Aaaaaaaaaaarrrrrrrrrrrrrgggggggghhhhhhhhh!!!!!!!!

You don't know what memories this brings back...

ROM is not copied into RAM. There is something like 386Kb left after boot
up but this is due to things like space for screen memory etc.

Sounds like you don't have the DNS set properly in the config file.
You'll need tto find the IP address of your provider's name server (DNS)
and enter that into the DNS portion of the config file. I had the same
problem -- except that I had inadvertantly entered the Gateway IP instead
of the DNS, so nothing was getting resolved.

: Hope some one can help !!!!

> This might sound like a silly Q but how much similarity is there
> between the structure of GEM calls e.g. wind_create, and their X
> counter parts - i.e are the parameters that are passed comparable?

I'm not much of an X or GEM programmer but I've had some experience with this.

At the VDI level there is a fair amount of similarity with the Xlib functions under X. However this is really all just line/circle drawing and clipping routines. However it was enough to allow me to do a port of CBZONE from X to GEM. I've half ported Xlander also based on the same principles. The main problem with both these games is not the GUI but the need for lots of floating point maths - which really require an FPU chip.

As for higher levels such as the AES and Motif or Xview I don't hold out so much hope. I have a couple of books on Xview - and I reckon some compatibility libs for GEM could be written - however its fairly pointless unless you have lots of Xview stuff - as Xview has more or less been supperceded by Motif now. I have no real details on Motif - and its not freeware anyway - so it might well prove much harder to work with.

> Any ideas / suggestions ? or am I bonkers?

I don't think you're bonkers at all. I just can't suggest an obvious way to go forward on this though.

:-)

Roland.

I'm sure tht lable on the W95 upgrade box states that W95 requires 4Mb to
run - but applications may well require more RAM.

Therefore IMHO if MS can show W95 boots in 4Mb they will have won the case.
Whatever - I can't see MS actually losing the case.

Its not exactly loaded into RAM AFAIK. True - once running you get
decidedly less that the full 512K - but this is due to data
structures/buffers - as opposed to the ROMs actually being copied into RAM.

All AFAIK and IMHO

:-)

> No, they _do_ work! But not without a hardware modification on Mighty Mics.. The instructions for this are provided with CaTTamaran at least.

The purpose of the modification is not to "make" the Mighty Mic card work with the CaTT; it is to disable burst-mode on the memory card. I know it sounds crazy, but doing this actually improves memory throughput in combination with a CaTTamaran. On Atari TT-RAM boards, this operation can be done by simply moving a jumper.

I have a Mighty Mic and a CaTT installed in my TT. The whole thing worked flawlessly, as long as I only had 4 megs installed in TT RAM. When I augmented TT RAM to 8 megs, I found that the machine would no longer boot up _cold_ at 48 Mhz (that is, after being turned off for a few hours). When I start cold, the first program in my Auto folder sets my TT to run at 32 Mhz. Once the machine is given a chance to warm up for 2-5 minutes, it becomes perfectly stable again at 48 Mhz, even for re-boots.
Go figure.

I had an email exchange with Ralf @ Cybercube on this topic. He suggested trying slower SIMMs. I could not followup on his recommendation, not having much cash to spend on this problem at this time.

Cheers

Yves Pelletier

Got it! It works beautifully. Unfortunately, CAB doesn't seem to want
to find my proxy server when I try to connect to any homepages. It just
gives me a 'Connecting to host...' message and then times out. Any ideas?

>
>Good luck,
>
>Claes

Hi Claes,
Just got a replacement disk from Oregon Research today.
Same problems. Installed ok but the graphics are screwed
up. I forgot to mention that I currenty am using the ICD Pro
driver to run my Segate Hawk (1 gig) with only one partition.
I did this as I am changing cases and had to remove
a couple drives, and made a back-up to the Hawk. I have
never had any problems doing this before (I don't use Cubase)
and nobody else in there complained :) The computer is running
box stock (Mighty Sonic removed). Every thing else (Apex, Rainbow
Kobold, NVDI) is working fine. I'll try installing it
on the IDE drive. It should meet the sector size requirement.
I'll post again if it works then.

Thanks,

Mike

"...it still needs to be loaded into RAM..."

FALSE!

TOS is not loaded from RAM into RAM.

Only the data required by TOS is in RAM.

The program code used to create windows, read/write files and so forth
remains in ROM.

RAM holds file buffers, the list of open windows, position of the mouse
pointer...

(If this is what you really meant, I am sorry. But your words left open
the possibility of a second erroneous meaning)

Same problem here, turned out to be a 0 byte size NEWDESK.INF, I deleted
that and allowed the Falcon to create a new one and it's now working
perfectly again.

CALLUM LERWICK (CALLUM.LERWICK@flight.org) wrote:

: And: How do I go about using STiK with tia? It doesn't say "Your IP address
: is:" upon startup so I have no clue what to do... (yes, I know nothing
: about SLIP other than how to start it going...)

Try just with a terminal emulator to see what happens and wich messages are
produced by your host. Then adjust your script.
For instance, I have to wait for the prompt '$', then give the command: 'slip'
Then the host askes : 'Starting SLIP. Do you wish to continue? [Y/n]:'
And the script must then answer: 'y'.
Then it gives 'your address: 193.79.220.146' (last number varies),
So it has to look for 'your address:'
Then it reacted with 'connected'

BTW, for me, it functioned only once, I could download the www.faq.
Any other time I got messages like 'Read Error in file : ...',
'STiK KRfree() memory corruption detected' and a lot of bombs.
Makes me feel really sad :-(

Found ST-Tools at the Umich mirror site, dropped it on a disc and took
it home to my ST.

It worked just fine, with a nice and easy front end, to boot !

The deleted file it found came up as *itmap.img, so it was a pretty safe
bet the first character was 'B'. It took a long time to Undelete it
though, about five minutes at least. Is this just lack of memory, I only
have 520k ?

Once undeleted, Elite ran fine. Thanks to all for your help, :->>

GEM (Graphics Environment Manager) is the name given to graphic operating system shell regardless of platform and consists of two parts; VDI (Virtual Device Interface) which handles the drawing to the screen and other devices and the AES (Application Environment Services) that handles the windows and the way programs communicate.

GEMDOS is the name given to a level of the TOS (Tramiel Operating System) operating system on ST type computer equivalent to BDOS in MS-DOS, DR-DOS or CP/M above BIOS and XBIOS.

GDOS is the name given to the bit of the VDI that was left out of Atari Computers and which drives printers and handles different fonts and has to be loaded from disk at boot time rather than being hard wired into the ROM.

I believe there are four ways of getting GEM running on a ms-dos platform

1. Digital Research wrote a version of GEM that runs on the x86 platform on top of DOS. Of course it runs applications that are native to the x86 and there weren't all that many written for it, GEM Paint, GEM Draw, First Word Plus & an early GST Timeworks DTP. It used to come bundled on Amstrad 1512 PCs.

The rest will run well written Atari ST software.

2. Gemulator by Branch Always Software is a card that contains spaces for Atari ROMS and gets the PC to emulate a Motorola 68K machine it requires a 486 or a Pentium with 8Mb RAM.

3. Janus a card that contains a 16Mhz 68000 Chip that behaves like an ST within the PC and thus is less reliant on a fast PC.

4. If you are running Linux/UNIX and X-Windows on your PC you may be able to get STONX a Freeware software emulation of an ST runnning, that requires the image of I think version 2.04 of the TOS operating system.

520ST upgraded to 1mb RAM - mouse - no floppy - Make offer

Atari SC1224 color monitor - works great -- Make offer

Omniswitch box - add a 3rd floppy, switch between color/mono monitors,
also has composite video out, and multisync out to connect your ST
to a multisync monitor. Again, make an offer.

Will ship UPS COD, you pay shipping.

I just checked the SPACE command: A 'NO SENSE' condition is
what should be returned in most cases and means the command was
successful. However, the Extended Sense Data should have something in
the lasat 3 bytes (I think it is these bytes), Number of Fields spaced over.
Ah, maybe it didn't space over any fields and is setting at the correct point.
Then what it should retrun is exactly what you are seeing.
I hope this helps,
Rich Mier

Ooops! I stand corrected; in the future, I'll steer clear of the technical aspects; what goes on inside the case (and even more so, inside the chips) is a mystery to me; I just like to push buttons and make things happen. I do know from experience that a 520 with TOS in ROM has more room to play when booted up, than does a 520 with TOS on disk.

From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95274.182347STIRRE31@MAINE.MAINE.EDU>
Source record: 158235

I am having the same problem with Stik. My system asks for the
username and then password. This works fine. Then my system will
say 'Packet mode enabled for IP address: 130.111.xxx.xxx.' So, in
my script I put 'find Packet mode enabled for IP address:' and
left the get ip command. I get a messege saying that I have an
invalid IP address, though.... When I check to see what happened in
my communications program I see that it prints the 130. So it
seems that Stik is receiving the last three combinations of digits for
the IP address. I hope I explained this decently....
Any help would be appreciated. Would CAB work with a connection made
by NOS? I can get that to work now thanks to a lot of help ;-).

34. Falcon-can't run programs (two bombs)

Newsgroup: comp.sys.atari.st
Date: 1995-10-01 00:00:00 UTC
From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.262.0000A327@cfcsc.dnd.ca>
Source record: 158237

Hi all:
Just recently I've been getting two bombs every time I try to start my Falcon up.
ICD boots the hard drives OK, but whenever an auto program or ACCessory tries to load it habngs and gives me two bombs. if I try a warm reset I usually add another bomb, for threee bombs showing.
I can boot only if I go to a drive with no autofolder and no accessories, or if I jhold down the alt key to bypass the harddrive boot process, but I still can't run programs.
I was trying to use an apple din-8 modem to db-25 serial adaptor on the Falcon lan port without success. could this have caused some damage which I am now experiencing as bus errors(2 bombs)? Or could it be connected to my IDE drive, with which I am also having problems(with bad sectors)?
any help, clues, etc most welcome :^)
thanks.merci

>this brand new drive.

:

Well, I had a halfgig quantum Fireball for my St, ordered from a mac place
too... couldn't get it to work via the Link adapter. Email to ICD suggested
either the parity needed changing (guess what? it had no jumpers!). or it
was one of the new Quantums which seem to be causing problems with a lot of
Atari drivers, even the Falcon... Luckily I had a 28day money-back-guarantee
so only lost on the shipping charges.

I hope you have better luck. :(

It is seemingly harder to get a modern scsii drive to work with the Atari
ST's (at least that is what I've experienced).

Good luck. Andy

I think it's better (very easy an faster) to use HSModem6.
(First you must Copy DRIVIN.PRG in your Autofolder, last SCC.PRG)
To Configure SCC.PRG use SETTER.TTP

programs
>
> either when Stik is installed.
> wasup?

I dunno! ;) I think we have the same problem, if I just load STiK and then
try to dial, the serial port seizes up and cant be used until I shut off
the computer *and the modem. Try this:

1) Boot STiK (I just load it when I want it with Chamelion)
2) Select STiK and click the Disable button
3) Load your favorite term proggie and give your modem an "AT" command. You
should* get an "AT" back from it. If not, somethings wrong...
4) Quit the term proggie and enable STiK
5) Then dial

Works for me. A real pain in the ass though...

(this is on a 1mb 520STfm TOS 1.0 with no serial patch. (need a faster
modem...(2400bps)))

Just do what I did: At your shell account, type "cat /etc/resolv.config" (I think thats was it was) Then pick an IP address at random (if there is more than one) and STiK it (heh) in your default.cfg file.

45. STiK - CAB - The Best Thing

Newsgroup: comp.sys.atari.st
Date: 1995-10-02 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <812669720_OASIS_@phil4.demon.co.uk>
Source record: 158104

For all you people out there reading this who wanna try WWW but haven't got a browser et al. Try STiK and CAB. I am using STiK V1.01 and CAB v0.?? And the two work absolutly PERFECTLY !!!! I haven't had ANY crashes since I got it working properly. The initial problems seem to be with setting it up in the first place. I being a complete beginner with Demon had huge problems. I contacted Steve Adams who fowarded me to another chap, who had been testing STiK and who managed to send me config files, that worked first time.

Please remeber when STiK or CAB bomb out on you, that these programs are in their infancy, that they are being written by 3 people, who are doing their hardest to sort out any problems.

I can really recommend these to programs, for free you are getting a fair amount of stuff for nowt. And there seem to be some very helpful people out there if you get stuck !!!

I have an Atari JAGUAR with one controller and the following games:

ALIEN VS. PREDATOR
TEMPEST 2000
CANNON FODDER
IRON SOLDIER

If you would be interested in trading your Atari computer equipment
for this package, e-mail me at the address below.

BTW, JAGUAR package is in excellent condition and has all boxes/docs.

From: musicman@sirius.pixi.com
Message-ID: <44nq67$78p@rigel.pixi.com>
Source record: 158155

I use an Atari 1040ST with Master Tracs Pro on my MIDI set up. I need to sync my Tascam 488 8 track tape deck to my Master Tracs program.

I am looking for JL Cooper MIDI Patch Bay and PPS1 or PPS2 also by JL Cooper.

The MIDI Patch bay I am looking for is the Nexus...Nexus/plus...or the MSB Plus 8X8. Preferably the MSB Plus.

Please if you have one of these lying around...I am in need. I was told there was one for sale locally...but it ended to be not a PPS1, but someone who just wanted to dump his old gear. It never worked with my Atari set-up.

Please email all info to ..... musicman@pixi.com

Thanks for your help and Aloha!

This sounds interesting. Now why would a 0byte newdesk.inf file cause a problem with running an auto folder program? I would have thought the newdesk.inf would not be referenced until the last auto folder program had run. I'll give it a shot though.

: Same problem here I'm afraid, must be a simple answer to this, but god
: knows what.

Well, of course I've said this thrre times now (too many threads on the same subject!) but the solution, for me anyway, was to install HSMODEM 6 (also available at HENSA). So, for a Falcon, the software you need is, in you Auto folder, FPATCH2.PRG, DRIVER.PRG, and SCC.PRG (the latter two are from the HSMODEM 6 package). In your root directory (eg. C:) you need STiK.ACC (or STiK.ACX if you are running under Geneva, as I am) and the STiK_CFG folder with all its contents. Then somewhere, anywhere, you need HTML.PRG and the other HTML stuff, and a folder for your cache (I called mine W3_CACHE).

The Upgrade Shop can supply you with the Overscan board.

They're in the United Kingdom. I have their telephone number as:

01625 503448

The installation is tricky, but not impossible if you have soldering
experience and it really is the cheapest upgrade path for basic video.

: it work with 256 or true color modes? I keep getting a "cannot initialise
: the DNS (name server)", why is that? I'm not even connected yet and it tells
: me that?

It didn't want to run on my Falcon until I ran HSMODEM 6 first. Now it works beautifully. If the program is hanging while trying to resolve server, or hangs a lot while receiving data, this is probably your problem.

It does work in 256 color mode. I haven't bothered to try it in True Color yet, but as it works is ST Low and every other mode I don't see why it wouldn't.

I don't want to appear to be looking a gift-horse in the mouth here, I am truly very happy this step has finally been taken. But the world hasn't stopped. Form support is a necessary addition. Soon tables will be ubiquitous and so support for those will be necessary. Then comes scrollable and fixed field areas. Also, I don't think that it supports mapped graphics properly yet, I always get an error clicking on a mapped image. I wish there were some way I could help in this endeavour as this is a utility I need. But aside from a shareware donation (already enroute)... perhaps beta testing, or manual writing?

Yes, if you are lucky enough to have a board like this. The ST PCB went through quite a few revisions and the one I have (Rev. H, I think) does not have positions for Bank 1. So....I had to do more complicated things.

DISABLED !!!! Only the LINK II and maybe the lastest version
of the ADSCSI+ can handle parity. Best just to turn it OFF.

Never mind, after wandering around http://marketplace.com/ for a half hour
I finally found the damn FAQ that tells you to use an IP address of
1.1.1.1... (tia isn't a true SLIP line, you have to use a dummy IP address)

BTW: It works! And rather well, considering my 2400bps modem..

> BTW, for me, it functioned only once, I could download the www.faq.
> Any other time I got messages like 'Read Error in file : ...',

I've had it do this to me before. Try deleting everything in you cache
directory. I've managed to get blank pages in there (by aborting pages or
"busy signals")and it will cause a read error... I dunno what to tell you
about KRfree(), had it tell me that a few times...

AFAIK the Falcon doesn't care. But I'd recommend having it disabled just in
case you need to hook it to an ST...

> 16Mb was the maximum for the MegaSTs.

4mb is the max any* ST or STe is supposed* to be able to handle, but some company figured out how to upgrade a MegaST or any STe to 12mb, it requires that you already have 4mb in your machine and that you have TOS 2.06

...and it isn't all that much more expensive to buy a used Falcon that will happily use any amount of RAM you can afford and is all around a better computer anyway...

> Also, for upgrading a 520ST to one meg, is it simply a matter of

You can do this with the 520STfm models (I'm no so sure about the very* early FM models though...) but it isn't this simple with the original 520ST... (the one with the external power supply & floppy)

Naw, its just that the earlier versions didn't install a cookie jar on startup, so you have to do it yourself with an autofolder program. (see my previous reply) My heart nearly stopped when I first saw this...

I think you've been ripped off! In HiSoft's '94 catalogue they are advertising
V4. HiSoft bought out Kuma's Atari stock a while back so no new version are
going to appear.

There are quite a few. Check out MICROS.HENSA.AC.UK in the micros\atari\tos folder. Get the INDEX files (about 98K) this includes all current programs stored here. In this list is an FTP SITE list (use a WP to search for it).

I have just tried ftp.wustl.edu ,in the \systems\atari\umich.edu folder, but it was so SLOOOOOOOOOOOOOOOOW that I didn't get chance to get a look.

Anyway try getting the list from Hensa for a good guide, or email me and I'll mail it to you.

Good Luck

94. Extra Colours

Newsgroup: comp.sys.atari.st
Date: 1995-10-02 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <812662808_OASIS_@phil4.demon.co.uk>
Source record: 158200

Hi,
This may sound REALLY daft, but here goes.

I have seen screen accelerators, such as NVDI and QUICK ST, and a few resolution enhancers, that either interlace or use a virtual screen for the ST (and STE).

These programs presumeably rewrite in someway the TOS display routines. Would it be at all possible for a program to be written to replace, say the med res routine so that it displays in the same resolution but with 16 colours. This patch should be replacing the colour reoutine, not interlacing the pixels on a LOW RES screen.

Any answer to this would be appreciated. Nb. I realise you would have to dedicate some more RAM to screen moemory etc.

Thanks

Phil Hough

Looking at the number of articles in this news area, and the helpfulness of the people here I think we'll manage but it does seem as though atari don't want us to buy jags (they got a funny way of enticing us !?).

>I love my STs and will continue to use them until they're dust. Luckily
>there are enough dedicated users out there that I'll probably be able to
>do so with relative ease.

Same here - Nb. On the trail of spares, I think atari sold there entire stick to sweden (atari sweden ???). My own power supply fried a few years back. It turned out to be just the 'switch' and Atari wanted to sell me a complete power supply (Mega STE, inc fan). for 70quid !!! The repair chappy replaced the swith for 2quid 50 and its worked fine since !!!

: What port should I use with a Falc (not that I haven't tried every combo already ;-)???
Discouraged definetly. The modem is not accessible by other programs
: either when Stik is installed.
: wasup?

You need to set it to Modem 2 in default.cfg for a Falcy. Also, you
need to set a serial port speed that is compatible with your modem...
if it is too fast, then the modem will not dial out.

101. emacs key bindings - the solution!

Newsgroup: comp.sys.atari.st
Date: 1995-10-02 00:00:00 UTC
From: cs93dlh@mole.dcs.exeter.ac.uk
Message-ID: <DFtKMx.7oq@exeter.ac.uk>
Source record: 158251

A while ago I posted a question asking how to remap keys in the full MiNT emacs (18.57.3) port so that the arrow keys and backspace worked correctly...

Well I recieved a total of zero responses, but after much trial and error I have worked it out for myself. Just in case there _is_ anyone out there interested, the solution is simple now that I have done the hard bit. :)

All _you_ need to do is to cut out the bit of emacs-lisp below and place it in a file called .emacs in your home directory (I am assuming a MiNTOS system is installed, with minixfs of course).

Once this is done, you will find yourself able to use the arrow keys to move the cursor, the backspace key to backspace. Help has been remapped on to the help key too!

```
-----------------cut here-----------------
(global-unset-key "\M-A")
(global-unset-key "\M-B")
(global-unset-key "\M-C")
(global-unset-key "\M-D")
(global-unset-key "\M-H")
(global-unset-key "\C-h")
(global-set-key "\M-A" 'previous-line)
(global-set-key "\M-B" 'next-line)
(global-set-key "\M-C" 'forward-char)
(global-set-key "\M-D" 'backward-char)
(global-set-key "\M-H" 'help-command)
(global-set-key "\C-h" 'delete-backward-char)
-----------------cut-here-----------------
```

And there you have it!

> No Cookie Jar

> What does it mean?

The "Cookie Jar" was a feature added by Atari to the operating system in the STE. It contains "cookies" of information about the machine, and is intended to be used by programmers when trying to work out what kind of machine the program is running on.

If you have a pre-STE model (in your case a 1040STF or 1040STFM), you will not have it. This is not fatal - a computer can carry on as normal without it.

A cookie jar can be retro fitted by some software.

Daron Brewood (dbrewood@nest.demon.co.uk) wrote:

> Is it just me but are there a lot of duplicated messages coming through
> this newsgroup?

Theoretically dupes cannot occur in Usenet. The message-ID of each
incoming article is compared against the list of message-IDs in the
news history database. Only articles which are not already in this
database are accepted. If you're seeing dupes, then you probably
have to rebuild your history database (or ask your news admin to
do so).

If OTOH you're referring to multiple posted articles (i.e. same
content, different message-IDs), this might be caused by people
trying to use Netscape as a newsreader. This problem is easily
solved by putting the offender(s) in your kill-file.

Dr Simon G.K. Williams (williamssg@cf.ac.uk) wrote:
: I am having great problems trying to create a partition bigger than 250MB

Sounds peculiar. BGM partitions should go up to 512MB without a problem.

However, I did hear something about some TOS versions (or was it some AHDI versions?) supporting up to 16MB GEM partitions, and other 32MB, before going into BGM. I wonder if this has something to do with it. Perhaps someone else can comment on this?

: on my TT's internal 1GB conner scsi harddrive. Everytime I do, the
: desktop locks up on trying to access this drive letter.
: I've formatted with atari's hdx utility version 5.02 and attempted to set
: the partition sizes to 30,50 and a big one of the remaining 900+MB, but

You cannot do this. Even BGM partitions cannot be any bigger than 512MB.

However you may be able to go over 512MB if you use an alternative filesystem, such as a minix or linux filesystem. I am not sure about this.

: SO, what is the limit on partition size on the atari? If it's only 256Mb
: then there's no point in me getting a 4 or 9GB harddrive as I could never
: create enough partitions to use it all! And what about direct-to-disk
: recording? Surely you need more than 256MB?

Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS version if I remember rightly, and BGM, AFAIK, can always be anything up to 512MB. There is no way to go over 512MB, except perhaps an alternative filesystem.

And, AIUI, under MiNT you can have drive letters all the way to Z, so a 9gig drive (18 partitions @ 512MB each) should work fine as long as you run MiNT.

I hope that is of some help,

-Mario Becroft <mbecroft@iconz.co.nz>

Jo Even Skarstein (josk@stud.unit.no) wrote:

> Give me telnet for STiK, and I`m gonna dump MiNTnet from my harddrive...

Dunno about telnet, but there will be a STiK compliant version of DUftp 1.1
RSN, although the MiNT-net version will be available first (ie. probably
later today). As DUftp for MiNT-net works best under MultiTOS (now does drag
and drop into desktop windows from remote servers), I'm doing a bit of a re-work
for the STiK version as I know most peoplewho use STiK will be doiong so because
they don't want to use MiNT / MultiTOS. Upshot - DUftp for STiK will be an accessory
using AV-Protokol to drop stuff into windows under Thing or Gemini.

Craig.

It has taken me 3 days to get this to work. The set up is really
very easy once you have and idea of the parameters that are really
needed. I think that there should be two set up files, one simple
and one with more options as the set up becomes confusing. Well, I
just got STik CAB working a few minutes ago and was able to get and
play MPEG' and color images! I will include here my set up as a guide.

make sure your Baud rate is 19200
on the Falcon use Modem 2
and disable data compression on the modem init. AT%CO
also get the HSMODA06.LZH and copy the DRVIN.PRG and SCC.PRG to the
auto folder. Put them in the Auto Folder in that order. These
programs fix the ports problem.
Create a Folder on your hard drive called Cache andset the path on
the WWW Browser to this folder
I hope this is of help to you all.
Raymond Lohengrin

```
#-------------------------------------------------------------------------
# Dial script file for STiK.ACC
#
#
# There are two parts to the connection process.
#
# The first part is initialising the modem, dialing a remote system
# and establishing a connection to a remote modem.
#
# The second part is to log into the remote computer. This will
# involve entering a username and password, selecting SLIP mode,
# and reading the Internet Address that your system will have for
# the duration of the session.
#
#
# Dial Script Part 1 - Establishing the connection.
#
# The first thing to do is to specify the speed of the modem with
# the BAUD_RATE variable.
#
BAUD_RATE = 19200
#
#
# Next you should define how your modem responds to the DTR
# signal. STiK will use the DTR signal to hangup the modem
# if HANGUP = DTR is set. Otherwise set HANGUP to the
# appropriate hangup string for your modem. (eg: HANGUP = ATH)
```

```
#
HANGUP = DTR:
#
#
# PREFIX sets the dial prefix (ie: ATD, ATDT, ATDP)
#
PREFIX = ATDT
#
#
# INIT set the string you can use to initialise the modem.
# This init string disables data compression. Raymond
INIT = AT%C0
#
#
# Dialing paramaters.
#
# The dialing parameters are CONNECT_WAIT and REDIAL_DELAY. These
# are times in seconds. CONNECT_WAIT is the amount of time to wait
# for a connection after dialing a number. REDIAL_DELAY is the amount
# of time to wait in between dial attempts.
#
CONNECT_WAIT = 30
REDIAL_DELAY = 2
#
#
# Phone Number(s). PHONE_NUMBER = number. Some providers
# have more than one number you can dial. You can specify
# up to five phone numbers here.
#
PHONE_NUMBER =3340200
# PHONE_NUMBER =2926200
#
#
# Determining connection success/failure.
#
# Connection success can be determined either by detecting the
# modems Carrier Detect signal (SUCCESS = CDWAIT), or waiting
# for a CONNECT response (SUCCESS = CONNECT) from the modem.
# Failure can be determined by a timeout or a modem response
# such as NO CARRIER, BUSY, NO DIALTONE etc.
# Up to five FAILURE test words can be set.
#
SUCCESS = CONNECT
FAILURE = BUSY
FAILURE = NO CARRIER
FAILURE = NO DIALTONE
#
#
#
# Dial Script Part 2 - Log in to the Service Provider.
```

```
#
# The STiK dialer uses the standard `conversational' method for
# login to the provider. This involves searching for certain
# words and sending an appropriate response. The special
# response $GET_IP is used to read the IP address that your
# provider has assigned you for this session. If your provider
# has allocated you a permanent IP Address, then you should set
# it in the default.cfg file and NOT use $GET_IP.
#
# Each step of the `conversation' is specified as a FIND line
# and a RESP line. There can be up to 10 steps. Each FIND
# must have a matching RESP, or the dialer will get confused.
#
# By default each RESP line is sent with a carriage return
# character at the end. If you need to use a line feed character
# instead then put a | at the end of the line. This only works
# if the | is the last character of the line.

I don't know the general answer to this, I did my upgrade by buying a
second hand 25MHz full 68040, which was £100.

Mygate Computing advertise such an 040 at £175+vat new. (I don't think
that's a trade-in).

113. AGGRESSIVE II PARTY!!!

Newsgroup: comp.sys.atari.st
Date: 1995-10-03 00:00:00 UTC
From: klawson@cc.Helsinki.FI
Message-ID: <44rbgv$afg@oravannahka.Helsinki.FI>
Source record: 158116

Sorry about the previous posting. Something seems to be out of order round here, or then it's just me :-)

This is a short advertisement about the Aggressive II Party in beautiful Finland.

The party is for Amiga, Atari and PC computers and the competitions will be combined so this will give you the opportunity of showing off your computer to others. The party will be held right in the center of Helsinki (which is the capital of Finland in case you wondered!) so getting there will be no problem whatsoever. It will begin on the 28th of December 1995 and end on the 30th of December 1995. There will be lots of great people there and something for everyone. You can enter the following competitions and win fabulous prizes:

Demo Amiga/Atari/PC. 'Motion' by AGGRESSION will be released in this category!

Intro, size: 96 Kb. Amiga/Atari/PC.

Intro, size: 4 Kb. Amiga/Atari/PC (no music).

Music: 8 channel, all common formats (MOD, MTM, S3M, XM, DTM etc..)

Graphics. Pictures up to 640x480, 24 bit are allowed. Most formats will be supported.

There will also be other events and sponsors showing off their new products and some Atari Jaguar developers. The party organizers will be, among others, Aggression (creators of the STe demo 'Braindamage' and the games Utopos and Stardust STe) and Future Crew.

For more information and/or an invitation with everything you need to know about the Aggressive II party contact:

EMail: krlawson@xgw.fi

Phone: +358-0-8593051

SMail: Kristoffer Lawson
Asemakuja 3C 53
02770 Espoo
Finland

IRC: Setok or any other member of Aggression. Look around on channels #atari or #kasvua. Or #dragonrealm on DALnet.

An intro invitation will be out soon.

Anybody wishing to sponsor this event should also contact us in any of the above methods!!!

- Aggressive II Party Organizers. AGGRESSION 1995.

> Clones at work.

I use Flash 1.062, and like you, I have found it's emulation to be bullet-proof minus the fact that it doesn't even try to display bold text (displays as inverse) and one of 2 other minor things. Due to this limitaion, I have to use the -show_cursor option on lynx to be able to tell what link I'm on.

I tried the demo for Flash 2.21, and its emulation was nearly as good as the original, but had some problems with VT300 emulation. It may be fixed now though. I didn't like the fact that Flash 2.21 was in a window (I know, needed for MTOS, etc...), but it seemed like a good program.

Nearly every other emulator I've tried has had flaws with VT emulation. We use a DEC VAX at school, and it seems to show every flaw in an emulator really quickly. <g> Unix doesn't seem to be as picky about it though.

121. TRADE: ICD mega2 internal thang for 1040st external hd thang.

Newsgroup: comp.sys.atari.st
Date: 1995-10-03 00:00:00 UTC
From: helling@uwindsor.ca
Message-ID: <DFw9GL.465@news.uwindsor.ca>
Source record: 158124

As above... I have an internal adapter board doohicky, bracket, wire, and software for jamming a 3.5" scsi drive into a mega2. It might have an L.E.D. busted off it, but is supposed to work fine (and it doesn't look very sophisticated-so not much to screw up).....

But I have a 1040st.. Also have a small scsi drive, a case, a power supply... need the mystery ICD adsci or linx, or whatever, the cable from it, to the 1040 and the software....

Lets swap.... If you are in Canada, this gets easier.....
US is do-able too....
helling@server.uwindsor.ca

122. Re: Help! What is partition size limit on TT harddrive?

Newsgroup: comp.sys.atari.st

From: waldi@moacs.indiv.nl.net
Message-ID: <PBE5BDW@moacs.indiv.nl.net>
Source record: 158125

Dr Simon G.K. Williams (williamssg@cf.ac.uk) wrote:

> SO, what is the limit on partition size on the atari?

The maximum size of a partition is one terabyte. However, your problem is not caused by exceeding the maximum partition size, but rather by exceeding the maximum size of a GEMDOS filesystem (which depends on the version of GEMDOS). On a TT (TOS 3.0?) the maximum size of a GEMDOS filesystem is 512MB, allthough this is really a waste of diskspace, because of the large cluster size (16KB).

On a 900MB partition you should use a different filesystem type.

: > and enter that into the DNS portion of the config file. I had the same
: > problem -- except that I had inadvertantly entered the Gateway IP instead
: > of the DNS, so nothing was getting resolved.

: Just do what I did: At your shell account, type "cat /etc/resolv.config" (I
: think thats was it was) Then pick an IP address at random (if there is more
: than one) and STiK it (heh) in your default.cfg file.

Actually, it's /etc/resolv.conf. You should use the first one listed,
since chances are that is the primpary name server. Also, many ISPs
run DNS on their own machines. For example, my ISP's IP address is
199.171.27.2, and so I use that as my name server...

(also, what's the chances of having multible name servers available
in default.cfg?)

I was wondering if anyone would know how I could reach 2-bit Systems, the authors of Replay 4. (A. Racine and D. Woodhouse) I need to know if there was ever a more recent release of the software than the one I'm using. Mine has an annoying bug that seriously hampers the package. (for me anyway). The MIDI function can't recognize the size of individual sample pre-sets. Anyway, if anyone has any information, please e-mail me. I know Microdeal was taken over by HiSoft....they were no help whatsoever. Anyway, thanks.

Source record: 158133

Drescher@foobar.co.uk spake thusly:
D > ST_Tools ... took a long time to Undelete it though, about five
D >minutes at least.

Whoa, Nellie... really? I have used ST Tools on both my ST and my TT for quite a while. Never takes more than a second or two for undelete on either machine. After all, all it does is change one character in the file name. ST Tools does take a short while to check to see whether the FAT entry is still valid for that file, but after it determines that it is, the undelete function is very quick. ST Tools file structure checking and fixing and optimizing is pretty slow, but undelete? - I am puzzled.

The person who is maintaining the pages screwed up, or something in their server is setup wrong. This is no bug in Cab/Stik.

After wandering around the TIA web page I finally found the FAQ that just
happened* to mention the IP address of 1.1.1.1, I never found anything th
said "Use this IP address!"... (btw: I got it to work. Other than finding
the damn IP address, no problem)

> If you're using a TT, and an older STiK version (before 1.05, STiK that is;

This happens sometimes on my ST with v1.01, both 1.03 and 1.04 crash on my
machine.

The old TOS's have cookie jars, they just didn't initialize it. Easily
taken care of with a small autofolder program.

I don't know if he can find these books, but two good sources are Zap:The Rise and Fall of Atari and Game Over which is about Nintendo but have good bits on Atari's involvment in the video game industry.

If I can think of anything to add, I'll post them. And if there's a way to put the report on the newsgroup, that will be beneficial to the readers.

>average user hasn't the foggiest it exists, let alone how to use it !!!
>They just bang in WIN at the C: prompt and thats it.

Well why not! Companies like Compact and Micro$oft brainwash ppl by
telling them that PC's are like VCR's but they're harder to use than
any 8-bit computer. I know one guy who blew $2500 but he still can't
get most of the programs to work. And a "analysis" program said that
it's not ready for Win95 so he would have to get a high-end Pentium
just to get anything done!! That really got me ticked and even more
mad at Dark Lord Gates(Oh don't get me started on him!)

>using a resonably user fiendly program.

That's how ST users get by. However, the computer industry seems
more interested in patroizing ppl with either "Dummy" books or
nerdish incantations known as user manuals. And they suck a lot of
cash out of them. This is why we live in the Dark Ages of Computers.

>Anywhere theres my bit - personally I think PeeCees are ok (I use one on
>occasions) however I think they are REALLY over rated, and people not even
>knowing there are other computers out there doesn't help. Still I prefer
>my good ol' Atari any day !!!

I love my STe, but to upgrade to a newer computer and get some
service behind...I have to get a stinking PC(Thank you Sam Tramiel).
At least I can kit it with some Atari emulators, and I will be
looking forwarded to a Jag CD card(I hope the CD games will actually
be playable). At least this is how it is in the States, but it's
coming to Europe soon; at least Germans are building ST compatibles :)
Anyone with thoughts on this subject, feel free to say them. Just
don't do any stupid flamming remarks; unless it's towards Microslop.

>vt100emu.prg from micros.hensa.ac.uk will do the trick. It's a German
>auto program.

Ok, so this is more of a question about vt100emm than getting Telnet in NOS. I checked Hensa but I couldn't find it there, is it anywhere else? Does this let me use VT-100 screens on say a VT-52 accessory. I was thinking of using this for IRC since Stalker doesn't do this to well. I had to use ST-Term, at lest I can change text colors :)

If anyone from Hensa(even Danny), please let me know if you have this, thanx.

>3.5"drives & mono high Res monitor.

>1. I want to print doccuments on my printer at work (connected to a PC)
>to produce a more presentable output than the 9-pin Eposn LX80 at home.
>Can ST files (from 1st Word)...[I lost the rest, don't know why]
>Do I have to use any special format? Is there any PD software available?
>Can I get printer drivers to output 1st Word doccuments to a HP laserjet 4?
>1985?

First, you have to save your documents as straight ASCII text. You
lose your bold, italics, and underlining however. Second, I think
the program you need is called PCFORMAT.PRG or something. I
recommend M-Desk accessory which let you do this because it's cool.
TOS 1.4 and above will automatically format disks in DOS format.

>2. This question may be part of the answer for above; the present single
>sided drives will any any PC expecting DD or HD, double sided discs.
>be subsituted for the 380K drive in the present Atari 354 (?) boxes?
>suitable? Will the TOS (version 1) format (set at double sided) the
>discs to 720K, especially in a 1.44M drive? I assume that I can't
>format these to 1.44M (HD spec).

You can use 720K drives which you should because no one uses SS
anymore. If you're replaceing the drive inside the casing, you may
have to cut around the eject button to make it fit. You can try to
use 1.44M but you can only use 720K. You need TOS 2.06 and AJAX chip
to use the HD format but it's hard to do especially on a 520STFM.

>3. What is the easiest & cheapest way of upgrading memory to:
>a. 1Meg
>b. 2 Meg or more?

I say you have to go for at least 1MB, but use 2MB if you're need a
lot of memory(like big applications or multitasking with Geneva). Or
at least you get a big fat Ramdisk which really does help if you have
no hard drive.

>Some advertisments offer un-populated memory boards in which "industry
>standard" SIMMS can be used. Can this approach be used in early STs?

>Will any Atari memory offered in the second-hand advertisments work?
>Are there any I should avoid?

You can't use SIMMS in STFM's but Marpet should have something.
Ask a British ST user where you can get a hold of these. (Hey, the
only ones I know are from ST Format, and I don't know where the guy
lives :))

>socket but no information about it in the manuals!

Ain't that a witching pig! :)

>Is this socket a standard SCSI output? Will any SCSI
>drive plug into it? Are all SCSI drives the same? - Will a PC SCSI
>drive work?

No, it's not a SCSI socket. It's Atari's own "variation" called
ASCI. To use any SCSI hard drive, you need either ICD Link 2, Top
Link, or Translator. Don't forget to get the ICD drivers to have the
ST even look at the drive.

>I would appreciate any help, advice and comments as I am
>very impressed with the 520 ST system. My many thanks in advance.

No problem Mike, feel free to ask questions about your Atari anytime.
We ST users always help each other out. BTW, if you want to use your
ST applications on your PC at work, check out Gemulator or Janus.
And check out Hensa and the Umich FTP site to build up your collection
as well as ST Format. Glad to be of help! :)

Eric Noss

a.k.a

Message-ID: <DFwxxn.Jxs@ridgecrest.ca.us>
Source record: 158052

Last month I bashed ST Format.
This months issue of ST Format was a nice change.
I felt that the articles this month were worth
my money :) See, it's not so hard. Stay on top
of Apex, Expose, Rainbow II, Neon, Afterburner,
Turtle Bay products ect.......... Get down to
it. Does Expose work with the FX and OutSide VMM?
Can it hang? Know what I mean? Do you know the
kind of animation you can get by hooking the
Cat Box SVH out into Expose SVHS in? An awsome
Falcon screen saver:)

ST Informer comes in second this month with
a great editorial content. It's nice to see
an editor that lets someone write an indepth
product review. One liners just don't make it.
My congrats! With a color mag, you would be first,
but then thats not the ST Informer I wait for each
month (or two) :).
Keep on Keep'n on

Atari World, very nice layout, but where's the
beef? The Atari market is up and down now, but
even if it's a revisited article, users need to
be kept posted on what's going on. Cover the
Medusa again. I would like to know more about
the 060 and 040 machines, or print some pics
of all the vaporware out there. A nice gentleman
from Germany just e-mailed me 3 JPG's of his FX-
Card. They were very interesting to say the least.
Does System Solutions carry the Fast-Ram board for
the PAK. Did you test it. Get my drift.

****
All Rags

Where's Don Maple? He has some interesting friends
with trick hardware in their machines.

Where's Tina Hackett (sp?). She was a cute and

To all that have problems with Quantum Fireballs (and Empire series):

My friend bought one last week and we had LOTS of problems but eventually
we managed to solve them: The HD can only be recognised by the ICD HD-driver.
The version we have does not support big partitions though, which is quite
nasty on a Gigabyte drive. So then we tried running Hushi (The driver from
SCSI-Tools 6.0) after starting ICD and then partitioning the HD using
SCSItools worked out fine .The two drivers "on top" of each other take a lot
of memory though, so remember to install ICD with almost no disk cache etc.

Install ICD as ICD.sys and then copy the SCSI-tools driver hushi into the
auto-folder as hushi.prg. It takes some time to install all this, but you get
rewarded with a working Gigabyte drive.

(before you start anything copy icd.prg and hushi.prg (just rename the .sys
files) to a disk. You will need them.)

If you have any questions, I'll try to help.

>Atari drivers, even the Falcon... Luckily I had a 28day money-back-guarantee

The Fireball needs a hard disk driver that supports bus arbitration, i. e.
HuSHI oder HDDRIVER. The ST hardware doesn't support bus arbitration at all
so the Fireball won't work on the ST. But it will work with TT and Falcon
except that you cannot boot from it because TOS itself doesn't arbitrate and
thus can't read the root sector

>It is seemingly harder to get a modern scsii drive to work with the Atari
>ST's (at least that is what I've experienced).

Concerning the ST I agree although most drives work. With TT and Falcon up
to now I had no single drive which didn't work and I tested quite a lot.

Does anyone out there know the email address for Caledonia PDL? I got a letter from them saying that they are online but I can't seem to find an address anywhere.
Thanks if you can help.

151. FS(UK): CHEAP Blank Disks

Newsgroup: comp.sys.atari.st
Date: 1995-10-04 00:00:00 UTC
From: Paul@pwomar.demon.co.uk
Message-ID: <812830960_OASIS_@pwomar.demon.co.uk>
Source record: 158061

Distribution: uk

I have recently found an incredibly good value for money supplier for floppy disks in the UK and thought that maybe I'd ask all you people out there if you wanted to club together and put in a big order to get them even cheaper. I have used them before and the disks are of an extremely good quality, they are ex-coverdisks and seeing as most magazines use fair quality disks it's hardly surprising. These disks are some of the most reliable that I have found. The prices drop drastically as the number ordered goes up, to give you some idea here are some EXAMPLE prices not including P&P in UK pounds.

Disks Price
10 3
50 10
100 18
1000 150

These prices are very rough estimates and do not include P&P. I am willing to consider any size of order, if you are even remotely interested then please send a mail request to: paul@pwomar.demon.co.uk stating the number of disks that you are interested in and when I have a rough idea of the total order size i'll tell you what sort of price they will be. The more people that reply the cheaper they get so if you are interested then please get in touch as soon as possible. Thanks for listening...

Good idea! Actually, pick the first one, if that doesn't work the second and
so on... That's better than picking a random one.

157. Some views on the Stik package...

Newsgroup: comp.sys.atari.st
Date: 1995-10-04 00:00:00 UTC
From: cs93dlh@mole.dcs.exeter.ac.uk
Message-ID: <DFxFoL.1Aq@exeter.ac.uk>
Source record: 158067

Downloaded the all new WWW package the other day, intrigued as to this possible mint-net replacement. After a couple of hours playing with it, here are my views. It may seem a little negative, but don't assume I am anti-stik!

Stik:

Nice system! It seems well designed and works quite nicely, with the sole exception that if I set the serial port above 57600 it starts losing characters between the modem and the computer... since 28k8 with v42bis gives a theoretical max throughput of 115200 I would prefer to use this setting as I do for Mint-net. And yes, I do have the right patches installed.

The only slight problem with it are the irrelevant entries in the config file - IRC configurations should be the responsibility of the irc program, not of stik!

9 out of 10 for stik - needs a little bit of polishing.

IRC.TOS:

Argh! I suppose it serves its purpose as a test of the IP connections but surely a telnet app would have been better for that and be more other use. As an irc client this is almost useless, doesn't support most of the protocol, abuses the additional guidelines (e.g. automatic sending of messages is a no-no - thats what notices are for!), no ctcp support, no dcc support, very slow scroll, no formatting of server output, no user protection... I shall stick with ircII (not IRC2 as it says in the manual - no such program!) under mint-net.

2 out of 10 for irc.tos - only good point is it works, sorta.

CAB Web browser:

Shows a lot of promise, but is far too slow! Doesn't seem to work with any web sites I tried, just comes up with "recieving... [0/0] and sits there. I have tried with compressed SLIP and uncompressed slip - still no joy. So giving up on the online aspect I tried to browse a few local files... argh. After 10 minutes of "formatting text..." (and this is on a Falcon!) I hit escape to be presented with about half the file. What was there looked pretty nice, with some nice speedo fonts and layout was ok, but at that speed, it is hopeless! I'd hate to use it online. Maybe it would be ok if it drew the page as it formatted - at least then you could see what it was doing. Doesn't seem to support inline JPEG images, or even all gif images, many HTML tags are ignored especially Mozilla (Netscape to you) HTML.

6 out of 10 for CAB - looks very promising but atm is a little too slow and won't work online.

So for the overall package: 7 out of 10

A big well done to the authors, BUT I really don't think the system was ready for release. With only a very limited abysmal irc client (which will probably discourage people from using irc) and a web browser that doesn't seem to work online it seems to me that the respective authors should have done a lot more polishing before releasing it! A telnet application is needed badly (far more so than irc for which there are telnet access servers anyway). My final words... not bad for a beta version but hardly up to release standards. I shall await a "finished" version before parting with any money. :)

IBM DPES-31080

I get 2800Kb/s from it with ICD driver (optimised settings!), and
in Falcon 2-color VGA mode. It does not calibrate (A/V) and it's
very quiet.
There's only one dip to change: enable "Disable Unit Attention" dip,
if you want it to work with CAF also.
Trouble-free, relatively inexpensive, fast drive.

In that case, why can't we just port this browser to MiNTnet and then
you won't have to switch at all? It shouldn't be hard; only the
socket-level stuff would need changing. How hard was porting DUftp the
other way, for instance?

According to a photocopy of a poor FAX I have, only Prodrive and Lightning drives have parity jumpers. Even then I would double check with the dealer before buying any new SCSI drive for an Atari. I took a risk with a Trailblazer - and seem to have got lucky. OTOH I have 3 machines with SCSI interfaces - so it was likely to work with one of them.

> It is seemingly harder to get a modern scsii drive to work with the

I think you are right. Ataris seem to work best with SCSI1 drives and SCSI2 drives which are under 1Gb.

Marpet do an XtraRAM board which allows a SIMM upgrade in a ST. The STM case is very short on room though - so it might not fit. STMs are upgradable though - I have a 2Mb card in mine bringing it up to a very respectable 2.5Mb. I could have had the whole 4Mb if I had wanted to though.

> 4. I have seen articles about adding a SCSI hard drive. The ST has
> a hard drive socket but no information about it in the manuals! Is
> this socket a standard SCSI output? Will any SCSI drive plug into
> it?

The ST's DMA socket is only half a SCSI solution. You need an external host adaptor unit such as ICD's The Link 2. Cost is about 80ukp.

> Are all SCSI drives the same? - Will a PC SCSI drive work?

They should be - but they aren't. You best bet is a SCSI1 or SCSI2 device of under 500Mb which can have its parity disabled. Many SCSI drives fit this description - but some of the newer ones are not Atari friendly.

A SCSI drive removed from a PC system is likely to work. I have 2 ST1280Ns (Segate 240Mb SCSI2 drives) which apparently came out of unsold Compaq fileservers. I have one working fine on my STM with ICD AdSCSI+ board (earlier version of The Link 2).

:-)

There's something called a TLS emulator on the Internet that someone told me about. But I can not find it anywhere. I to want to emulate a 8086 for assembly class on my ST, but I have to use a 486 in the lab. If anyone knows where it can be found, please let me and that guy above know. Thanx.

Are you talking about K-Spread v4.19 or K-Graph v3.11? I upgraded both
at the same time.

I have been trying to use Slirp from my unix account & to get Stik to connect to it, but I'm not haveing a whole lot of luck yet. As I'm trying a direct connect (not a dialup), when I click on connect, the system goes thru the spiel then says connected... but then the timeout count runs out and Stik goes away. I am using SUCESS=DIRECT. How can you tell is Stik is talking? Does it say something on the screen?

Hello Simon,

I currently have a Quantum Lightning 730meg drive on my TT with 160 meg partitions and have had for several months with absolutely no problems. I do however use ICD Pro hard disk drivers and originally formatted the drive with this. I also have a Syquest 88 meg drive and format my cartridges to the full 88megs and have had no problems. I have found the ICD drivers much faster than the Atari and I have also experienced NO problems with them at all. I think I have version 6.6.4 (the latest is 6.6.5 I beleive). According to ICD I beleive it is possible to have up to 50 or 60 GB of hard disk storage on the Atari. I am not overly technical but do beleive that 200 or 300 meg partitions should be no problem. Personally I prefer to keep my partitions smaller and I also often use Diamond Edge to optimize them. I don't know zip about hard disk recording but I do beleive this is a problem from what I have previously read in the various newsgroups. I often see people having problems with hard drives and often wonder why they have so many problems. I think it always pays to use up to date software and a little housekeeping to keep the system working okay.

Anyway I hope I have been of some help. This subject may also be of interest to other users so maybe you can post any information that you manage to get.

Regards for now..
Mark

I was once told that 256megs is an AHDI/HDX limit, not necessarily required
by the system and other drivers don't have this limit. But I wanted to format
a disk with only 500megs, so the 256megs weren't really a problem.

> Is there some program to reset my TOS version to fool the program? Is this
> patch actually available?

The PATCH.PRG program is required because Megamax's Laser C hooks itself _deeply_ (and I do mean _deeply_) into the computer. By doing so, it needs to be patched for each and every different TOS version. This was OK in the early days, as new TOS versions came out perhaps biennially (every other year).

The payoff here is that it makes it a _LOT_ faster than comparable compilers - even on slowcoach TOS versions before 1.4. On a non-harddrive system, it was perhaps twice or three times faster than Lattice C 5.

The description of why it burrows so deep, and what you need to do is in the "About" box selected from the menu of the patch program.

If you have the full Laser C program, it came on one of the four discs.

Sorry, I can't help with the info that program required. I only ever used it on my 1040ST and then the Mega ST - both of which were supported by it, as they used Blitter TOS (1.02).

I believe that Megamax may no longer be "alive", although I guess I'll be corrected (politely!) if I am wrong.

From ftp.micros.hensa.ac.uk go to micros/atari/tos/tools and grab zoo21.tos
> Additionally, there are also files with a .SEA extension. Same
> question
> for this type of files.
This is a Self Extracting Archive (SEA), probably created by DCSEA IIRC. I've
never used it but I think all you do is change the extender to .TOS and it
should extract itself.

> Can't you buy a FPU for the LC (LC040) range of Mac's? I was told you
> could. :)

The LC040 lacks the "talk to attached FPU" logic on the CPU die.

The only way of getting a hardware FPU on an 68040 system is to either opt for a full '040 at time of purchase, or to upgrade the processor to a full '040.

BTW, i believe that this has been discussed recently in the comp.sys.m68k group, and it may also appear in the FAQ for the group.

Aloha,
Finally got STiK and CAB up and running...
What would be the ideal Cache settings for a 4 meg Stock 1040STe?
I'm running NeoDesk 4, Geneva, and NVDI/GDOS...which leaves pretty close to three megs of memory to play around with. The Hard Drive partition of my Cache folder is a 16 meg partition that is about half full.
Also, I get two bombs quite frequently...about every other download. I'm assuming it is CAB since that is the application Geneva boots out of memory on the crash. Guess it could be a problem with STiK...
Any Ideas?
Thanks,
Brian

>
> I have the chance to buy 4x4mb 30pin 9 chip, 9bit 70ns simms. Are
> these likely to work?

I have heard of some problems with the Wing card (at least older ones): they can sometimes disturb the signals from the internal harddisk and the drive, for some strange reason. I've heard different wiews on this, but haven't tested myself, since I've got Hard&Soft's RAM2000 card, where there is place for one 72-pin SIMM (4 or 16MB), instead of the 30-pin SIMMs.
Another advantage with H&S's RAM card is that it doesn't use more room than the original RAM card. With the Wing, you have to cut a hole in the shielding (or remove it). You can also fit a Speed resolution card in the computer with the H&S RAM card - the Wing uses more space and the Speed resolution card can't be mounted where it's supposed to be.
Someone told me there was some kind of grounding problem with the Wing and that it could be solved by soldering additional grounding wires from the card to the motherboard. Someone else told me that it was sensitive to which SIMMs are used and that the best ones would be 9-bit, 3-chip SIMMs of 70ns.

> Also, what is the difference between ST ram and Fast ram? Are the
> simms themselves different or is it just how the rest of the machine
> accesses them.

I'm not sure about this, but the fast RAM (also called TT-RAM) I believe should be accessed faster than the ST-RAM by some other kind of CPU access, but all programs can't make use of TT-RAM.
Maybe someone else knows more about it?

> I would like to be able to use these simms in a future fast ram
> upgrade.

This could be a tricky one, since I believe that all fast RAM upgrades will use 72-pin SIMMs in the future. Anyway, the Hawk does and as far as I know, it's the only one around so far...

If you use Cubase on your Atari, get a Steinberg Midex+, which gives you SMPTE,
as well as four extra midi inputs, two extra midi inputs and four slots for
cartridges. It's expensive but it does the job well.
You can also get the Steinberg SMP-II, which is rack mounted, has a SMPTE time
display. The rest is the same as Midex+, except for the key slots.
It's even more expensive, but it works perfectly.
The Midex+ can't be used with a Falcon, but the SMP-II can.
You might be able to get hold of a used Midex+ at a fair price. There is
another unit called Midex (without the +), but it lacks the SMPTE.
Other possibilities are boxes that translate the midi clock to a kind of time
code (they're much cheaper than the Steinberg boxes), but that sort of time
code isn't as stable as SMPTE - and more sensitive to tape dropouts.

Best regards,

> to have to sell off this brand new drive.

I'm sorry to tell you, but most of the new Quantum drives are SCSI-III
compatible and according to Atari these can't be used at all with the Falcon
(or other Ataris for that matter). The best is to stick to other brands.
I believe that the Quantum Lightning will work if the shop still has any in
stock, if I remember correctly it's out of production...
Most other drives should work, just check out that they are real Fast SCSI-II
drives and NOT SCSI-III compatible.

Good luck,

Claes

195. How do I local network PC & TT with mintnet?

Newsgroup: comp.sys.atari.st
Date: 1995-10-05 00:00:00 UTC
From: Aces <jason@whatnext.demon.co.uk>
Message-ID: <41126794wnr@whatnext.demon.co.uk>
Source record: 158014

I've been running mintnet, installed with the TAF disks, on my
TT030 and I've just got an rs232 lead to connect the pc to the
TT030.

Can anyone tell me, in as simple terms as possible, how to set
up mintnet to communicate over a serial cable with trumpet winsock
on the PC preferably via PPP. I've tried reading the text
files but they haven't made it much clearer....

I've currently got a 14,400 modem connected successfully
with PPP at 38,400 on the serial 2 port on the TT and was
thinking of using modem 1 between the PC and the TT030 as the
PC only goes up to 19,200.

: atari.archive.umich.edu (and mirrors)

Well, that's great news, but it would help immensly if you could
point out the directory as well. I've wasted a lot of online
time/money looking for it without finding the program.
By the way, does this program now work with US Robotics "Sportster"
14.4KBaud modems?

197. Atari .IMG to Mac PICT

Newsgroup: comp.sys.atari.st
Date: 1995-10-05 00:00:00 UTC
From: Jim Hronchek <jahronch>
Message-ID: <4518ms$mm2@kocrsv08.delcoelect.com>
Source record: 158016

I have written a drag and drop application for the Mac (system 7.5) that accepts
B&W .IMG files and converts to Superpaint PICT files.

The program is used to simplify the music publishing process. (I use Pagemaker)

Is anyone interested in knowing more about this program, or the process that I use to publish my music?

Jim

198. Transwarp software ?

Newsgroup: comp.sys.atari.st
Date: 1995-10-05 00:00:00 UTC
From: Jim Hronchek <jahronch>
Message-ID: <4518vj$mmm@kocrsv08.delcoelect.com>
Source record: 158017

Some time ago (1987-1989) there was an article in one of the Atari magazines that described Transwarp (TWARP.C) written by Dave Small and ???

The software was intended to optimize the access of the floppy disk, claiming an increase of 50% or better.

The software that came with the magazine subscription was written for one two versions of TOS. I would like to know if there is a later version for use with TOS 1.4 and later?

Has anyone seen this?

We have 2 Quantum Lightning 730M drives, one used as internal TT drive
and one used as external TT asci drive right now. (may move it this
weekend after a bit of playing around to check out performance. It
doesn't get as good of performance as the internal one right now -
that may be interleave problem - or maybe I would be better off with
it as just a straight scsi drive. ICD Pro 6.6.5 currently used.

> Oh, one other thing- the person I bought the tape drive from asks me
> if Atari systems prefer parity enabled or disabled. Does anyone
> know which one is required for Archive drives for the Falcon SCSI
> port?

Hello David,
The Falcon ignores the parity, so you can use almost any SCSI device.
You don't have to think of the parity bit - just connect and go...
Beware of units that are SCSI-III compatible - it seems that they are having
some problems emulating SCSI-II.

Best regards,

Claes

211. Informal Survey on ST Mono Monitor Longevity

Newsgroup: comp.sys.atari.st
Date: 1995-10-05 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DFy8z3.CFD@freenet.carleton.ca>
Source record: 158089

Here in our local ST community (as I believe is the case elsewhere) used ST colour monitors are common but monos are SCARCE. In accounting for this, several people I know have suggested that the colour units keep going like the energizer bunny while the monos have a higher mortality rate. I tend to believe this myself, since I know of half a dozen cases of mono mortality and no cases of colour crap-out.

My view is based on an admittedly small sample size. Perhaps, in an effort to resolve this issue once-and-for-all people could advise me(by email) of their experiences with Atari Monitor expiry (specifically whether your now defunct unit was Mono or colour and preferably what model it was).

I'll tally the results and post my findings to this newsgroup; perhaps for all time resolving one of the great mysteries of the universe.

If you care to participate in this survey, kindly send me an E-mail (to cb092@freenet.carleton.ca). Please don't post to this Newsgroup since I don't have time to cullthe results amid the many unrelated posts.

Many thanks,

Keith Murchison
cb092@freenet.carleton.ca

TOS can only handle 14 BIOS drives but more GEMDOS drives. The MiNT drive U
is a GEMDOS drive. With Magic 3 you can have up to 23 BIOS drives, i. e. 23
"real" hard disk partitions. (C-Z without U.)

chandler@village.ios.com (John Stanmeyer) wrote in a message about Atari vaporware:

> What about the Atari ABAQ Transputer Workstation???

ATW was released - though not very many were sold. It came too soon for the market I guess (nobody knew what it was good for back in the dark ages...) and was too expensive. The problem could also - as usual for Atari - be bad (or complete lack of) advertising. ATW was built on a T800 transputer and had a Mega2ST for control functions. It was built in a towercase.

> Or the Atari CD-ROM (it would have been basically the first consumer
> affordable CD-ROM ever if they had released it ontime, or ever

The CD-ROM from Atari was also released. Some years ago, when it was available I even sold a couple at the shop where I worked back then...

> period...) Or the 8 zillion Jaguar games that were supposed to be out
> in time for last Christmas (or was it the Christmas before that???)

Don't know about 8 zillion, but it hasn't been a good move to release the Jaguar before a great quantity of games are available - that much is true. The delay of the CD-ROM drive is no hit either... The VR-helmet was also delayed...
How many titles are available for other new game consoles - like Saturn, Playstation or whatever? From what I've heard they're just as few as they were for the Jag at the start.
Besides, have you ever heard of ANYTHING regarding computers, from any manufacturer, that was released on time? I haven't.

> Or the Atari 1450XLD!?!?!?

Never heard of it - maybe a rumour that has been initiated somewhere on the net?

> Atari... announce vaporware??? Nah! Never!

Not to my knowledge, but for the time being we all put our hopes to C-lab.

I had a mono monitor in Australia for about 3 years, and have had one in
UK for 4 years (not much work in the past 12 months though). I have had no
problems, but 2 is hardly a good survey :-) Any help?

I have the following for sale:

2 Atari TT030's -one works one is a parts machine, the one that works has 6 megs of ram (expandable to 22 with the board that is in it) that needs reseated (bombs occasionally). The working TT has the 1.44 drive in it, the hard drive it did have died on me, takes a normal scsi. Extra TT keyboard and mouse.
Other goodies:
Nashua mouse, joysticks, external DS/DD floppy, tons of euro magazines, tons and tons of software, eg. Pagestream, Dynacadd, Spectra 128 with Mac software, Cubase Notator (600.00 new), Devpac 68k, Devpak TT, tons of other programming languages, many games (app. 100+ originals), books, hundreds of misc. disks and software. I have some other stuff but can't recall it all now. I will take the best reasonable offer.

DUftp doesn't need an installer program. When it's unpacked, it's installed.
It was designed to work with MiNT-net. If you don't have or cann't install MiNT-net,
that isn't my problem is it? Either learn or get help - or hassle Kay Roemer for an
installer.

> Especially the very UN*X-like MiNT requires very much knowledge - and there isn't much
> comprehensible information easily available. And, sadly, packages like DuFTP and OASIS
>don't help much with setting up the connection! They apparently presume that
>one knows how to use MinixFS, SLIP, etc. This has to change, if these programs are meant
> for common use among all kinds of people.

You seem to have missed the point here. DUftp is designed to provide a pretty
FTP client for MiNT-net users. It isn't an internet connection package, and was
never designed to be one. That's like saying that Kandinsky should have a comprehensive
installer for GDOS included with it - don't be ridiculous.

> Or are Internet-services on Atari platform meant for "pros" only.. ;-) ?

No - but they are meant for people who deserve them (evidently not this guy).

Sorry if I sound a little narked here, people who know me will know I'm usually
happy to help, fix bugs, even do over the phone step by step tutorials.
But I do get annoyed when someone posts slating my software as obscure & difficult to set
up without having the courtesy to mail me first for a little help, before making
me out to be some sort of elitist who makes my software obscure on purpose.

Get help first - then winge if you need to.
(My mail address is plastered all over DUftp, even in the about dialog)

Craig Graham.

I think you are right. If I remeber rightly A1200 (yes I know its 'cr*p' but
this is just a quick example), has a 68020, making it slower than a Falcon,
however this is a 32bit chip, so as ST stands for 16, 32 if you transplanted a
68020 you would have a 32,32 or TT (that sort of thing). However as all the
other chips and circuitry around the ST are 16bit (hence /16/ 32), then obviosly
they wouldn't work too well. So to make them work, you'd have to basically
build yourself a new ST motherboard !!!!

:
: How do you do this? (A Genuine question!!)
:
: When I load MiNT, I get an extra drive U. I have not been able to define
: other drives between P & U.

I've never donethis with Hard Disc Drives, but i do have a RAMDisc in /ram with an alias as drive R. So it would seem that it does work, and I was able to install an icon for drive R on the standard desktop.

I think that the Hard Disc Driver software might not support the extra partitions, and this may cause your problems, but I'm really not sure. AHDI software can partition up to 24 partitions if I remember rightly (per drive), so I should think you wouldn't have any trouble with this.

I would have thought that if the number of partitions went past P, the OS would automatically carry on past P. I guess you just have to experiment. At worst, and if you have two drives, you could put one on one computer and one on another computer and network them with NFS. Then you can mount the other computer's filesystem onto one computer, and access them both from there.

When you say you're unable to "define" drives between P and U, what exactly do you mean? I've been able to use drive R, as I mentioned above, and I have made aliases to X and so forth from drive U with no trouble (using the mint.conf alias command).

So, AFAICS, you shouldn't have a problem. But then again, I've never tried putting enough partitions on a drive to go right past P, I've only had aliases past P.

> Trouble-free, relatively inexpensive, fast drive.

Your SCSI-drive probably works great, but the transfer rate of 2.8MB/s is impossible - the program that says this is lying (or maybe it's only reading from a software cache memory and not from the drive).
According to the schematics for the Falcon, the SCSI-port is limited to a maximum of 2MB/s, because of the bus speed in the machine. I've had this as an answer on a direct question about this from Atari in Holland as well.
With my Conner SCSI-disks and SCSI-tools (HuShi) I get a transfer rate of 1.8MB/s according to the tests in SCSI-tools.

Best regards,

Claes

Hi there!

I know that you all get tired of answering these types of questions, so I'll try to be as vague as I can be.

I have just been given the "gift" of a 1040 STF. Now I am a long time PC user and don't quite know what to make of this thing, however I am quite intrigued with the machine. It seems to me that it should have kicked any Intel 286 class machine's ass.

This leads me to the real nature of this post. I want someone (anyone) to explain just what it is that I have. It boots up and looks nice, but is there any software that can be used for real productivity out there (FW/SW would be nice)? Where can I find a larger hard drive? Do I need a larger hard drive (It has a 20mb now.)? What about memory? ... I would be delighted to hear more about the MIDI capabilities and such as well.

E-mail would be the best way to respond as I don't check the newsgroups much.

Thanks in advance for any help,

Dave

I have the following Atari STFM upgrades etc. for sale (in the UK):

• Power Computing 2.5 Mbyte RAM upgrade for STFM •40

• TOS 2.06 upgrade for STFM (software switch-able) •30

• SF314 external floppy disc drive (double sided, double density)
•10

• Internal floppy disc drive (double sided, double density) •10

• Internal power supply for 1040 STFM •5

• External power supply for old 520 STFM •5

• Hard disc controller for ST-506 drives •10

Software (boxed):
• Fun School 3 for the under 5s •5
• Diamond Back II (hard disc backup) with manual •15

If interested in anything e-mail me: ianp@knx.co.uk

240. Atari Know-Nothing Needs Education!

Newsgroup: comp.sys.atari.st
Date: 1995-10-06 00:00:00 UTC
From: soupigf@enterprise.america.com
Message-ID: <452e4g$85e@enterprise.america.com>
Source record: 158032

Hello! I recently aquired a 30 meg SCSI drive...an Atari SuperDrive, to be precice...in the hopes of hooking it up to my old Mac Plus.
It seems that two Atari ST computers, an external floppy, and a SC1224 monitor were included in the $30 asking price.
No I am intrigued...I have heard a little about these machines, but I realy don't know the first thing about the Atari ST system. I tried to obtain a FAQ, but rtfm.mit.edu was of little help. (If anyone has a faq or two or twenty they want to throw my way...it would be much appreciated.)
I have a 520ST and a 1040STF. The 520 and its disk drive did not come with any cables or power supplies, or even a mouse. Will a joystick work to move the mouse cursor about on the desktop?
Also: are there any substitutes for the power supply (can I use an Amiga or c-64 unit? Or do I have to build my own from scratch?) What about the floppy drive cable? Does it have any common equivalent?

I hooked up the 1040STF to the monitor and the hard drive and fired everything up. I got a nifty is sparse desktop, with two little file drawer icons and a trash can. I had loads of fun switching the resolution between medium and low, and attempting to specify non-existant drives, but that was about it. The hard drive was spinning and humming, but the ST seemed oblivious to it. I understand the OS is in ROM, but what about a HD driver? Do I need one? I havent been able to test it out on my Mac, and I really don't want to format it until I know there aren't any ST goodies on it.
The drive also seems to have no way to set the device number(haven't cracked the case yet, but that control should be on the outside.) and no SCSI terminator. Does it need a terminator, or is there an internal one?
I found a single disk in the spare drive, and I fired it up. It appears to be a software catalog a couple of years old, and a text viewer. Had tons of fun playing with mouse buttons and scrolling. B)

I will be picking up an Atari emulator for my Mac (assuming that there is a 68000-based version), and I suppose I need to know a good ST ftp site to pillage for term programs and such.
A list of "Must Have" software would be appreciated, as would any informative text files.

Post any responses here, or feel free to e-mail me at

soupigf@america.com

TIA!

Terry May (Terry.May@rebel.genesplicer.org) wrote:
: What are the best Atari FTP sites?

atari.archive.umich.edu seems to be very popular, but you'll need to use a mirror, as the atari.archive itself is very busy. I like src.doc.ic.ac.uk/packages/atari/umich myself. There are a couple of others.

HENSA/Micros Atari Section also seems to be popular, but due to the peculiar directory structure, it is hard to use via FTP. If you connect to the www page though, you can look up packages by number, name, popularity or almost any other way you care to mention. http://micros.hensa.ac.uk/. I forget the path, but you can just follow the links to the atari section.

ftp.cnam.fr also seems to have a lot of Atari stuff.

Some others are:
ftp.uni-kl.de
ftp.uni-muenster.de
ftp.uni-paderborn.de
ftp.cs.tu-berlin.de

If you want a comprehensive list, look at Mark Smith's Atari WWW pages "Atari on the web" at http://www.mcc.ac.uk/~dlms/atari.html. An ftp list is in something like "Other atari related documents or FAQs".

Hope that helps!

Ah! This must be where the difference between BIOS & GEMDOS drives becomes
important. Uwe Seimet mentioned these terms in a recent post.

Maybe the RAM disk is a GEMDOS drive (like MiNT's drive U), so TOS can handle this extra drive, but can't handle another physical drive partition.

Which RAM disk program is it BTW & how do you set it up?

As to my problem, I have 8 SCSI devices on the bus & use AHDI.
The last hard disk drive is SCSI id 6, & this has two partitions. One of these is a 115 Mbyte BGM partition, the other is a 120 Mbyte Minix partition.

Since TOS can only handle 14 BIOS partitions, & the BGM is defined as drive P, I can't get drive Q to appear on the desktop (by doing the usual install drive method).

If I want to use the Minix partition, I have to hide another partition to free up a drive letter (I use Supraedit.prg to disable the partition, I know ICD has a better method, but I don't have an ICD adapter).

Perhaps an XHDI compliant driver migh tbe able to expand the partition tables to allow more. I understand that Magic 3 can have 23.

Does anybody know when HD Driver 4 is out?

: Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS
: version if I remember rightly, and BGM, AFAIK, can always be anything up
: to 512MB. There is no way to go over 512MB, except perhaps an alternative
: filesystem.

There are two important limitations in TOS which determine the maximum size
of a partition:

(1) Maximum logical sector size
(2) Maximum number of logical sectors in a partition

The maximum logical sector size accepted by all TOS versions seems to
be 8 KB. I have seen reports about certain Falcon TOS versions which
indicated that more than this is possible there. For GEM partitions,
the logical sector size is always 512 bytes. BGM partitions change
the logical sector size and thereby push the partition limit.

The maximum number of logical sectors is 32768 for all non-Falcon
TOS version (if my memory serves me right). If you have a clever
partitioning program, it can apply a "patch" to the partition which
makes it possible to operate a partition with 65536 sectors safely.

Summing it all up, 256 MB in a BGM partition using 8 KB logical sectors
are safe on all TOS version. 512 MB are possible using the mentioned
"patch". Everything beyond this seems to be uncharted territory,
at least to me, and only the latest and greatest TOS versions
should be used to test partitions larger than 512 MB.

> (logical) floppy drives.
> --

So if I examine the _drvbits variable when running MiNT, I should see a
bit set for the U drive. Would it be something like this (for my setup
anyway) :-

Without MiNT
Binary 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 0 0 0 0 0 0 0 0 0 = 02FFFC00
Drives A _ C D E F G H I J K L M N O P _ _ _ _ _ _ _ _ _

Running MiNT
Binary 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 0 0 0 0 1 0 0 0 0 0 = 02FFFFC20
Drives A _ C D E F G H I J K L M N O P _ _ _ _ U _ _ _ _ _

I may have got the bit order wrong here, ie. maybe drive A is the LSB.

How do you get MiNT to use any extra partitions that GEMDOS ignored?

Since I have set up the Minix partition so that it is only available to
TOS when MiNT is running, I would not mind if only MiNT could ever see it.

: > to have to sell off this brand new drive.
:
: I'm sorry to tell you, but most of the new Quantum drives are SCSI-III
: compatible and according to Atari these can't be used at all with the Falcon
: (or other Ataris for that matter). The best is to stick to other brands.
: I believe that the Quantum Lightning will work if the shop still has any in
: stock, if I remember correctly it's out of production...
: Most other drives should work, just check out that they are real Fast SCSI-II
: drives and NOT SCSI-III compatible.

How is it: in MausNet people seem to think that Quantum Fireballs CAN be connected to Ataris - *IF* you use driver software capable of something called "bus arbitration" (or something like that anyway..). AHDI does NOT support this, and neither do most other HD drivers! One that works is SCSITOOLS (new version).
So, if they're right, then there's no need to sell your Fireballs - but instead to purchase SCSITOOLS from Germany!

Correct me, if I'm wrong...

Greetings,
Tommi

Have you thought of installing a minix file system to stuff your html
copies into? That should get you past 8.3 allowing 14 character filenames.
I realize that still may not be enough for all cases.

Yes, me too! I used the initial version of STiK successfully,
but now I have the same problem: "Error reading file..."

> 14 MB. ------
>
> The 68030 data-Bus is 32-bit, hence 2^32 Bytes address space.
>
> FastRAM can be more than 14 MB.

Absolutely right, and when I get the Hawk030/48MHz that I've ordered -I'll be
able to have up to 80MB of fast RAM. Whew! - I'll never run out of memory
again!!!
Not to mention all other advantages with 16 MIPS, 1280*960 dots in 2-16 colors,
video RAM, optional 486DX33 emulator, future upgrade possibility to the
Barracuda040 etc...

Best regards,

Claes

Well dunno If you got a reply or anything so here you are..

I upload all new versions to ftp.demon.co.uk /pub/atari/new
I also uplaod to a few other sites irregularly, Danny uploads new versions to
hensa and I dont know about other people.. it seems like its on just about all
atari ftp sites now.

Latest package is www106.zip

it includes
Cab 0.98
Stik 1.07
html.ovl ehh dunno about this one :-)

You can format a DOS 720K disk if you have Tos 1.4 or above. If you're using any formatting software, use 80-9 which is what DOS uses. I recommend using M-Disk accessory which also doubles as a resizable Ramdisk.

For what it's worth I have nothing but good things to say about them.
Decent prices, great selection, good return policy, low shipping charges,
and *excellent* service--very friendly and knowledgable. For example,
Magic 3 is backordered right now and they don't seem to mind me calling
every three days or so to get an update on when it's going to be shipping.
A far cry from what my Mac and PC owning firends have told me about the
Zip drive fiasco with MacWarehouse.

I'm not affiliated with Toad of course, just a very happy customer.

I've had great dealings with Toad!
They really seem to have their act together...
Have a good sense of humor...
And have proven that they really want my buissness.
I'd like to say I can vouche for their service department, but I've never had to send any thing atari/atari related in for repairs, so I don't know how they do here.

Once I ordered Atari Works from them...and they had to go on back order for the Speedo Upgrades...but they came through and managed to get it all straight as soon as possible. I really appreciated them being honest and not trying to jerk me around like most places do when there is a genuine problem. Heck...most places would have just shipped it to me with the old version of Speedo...sticking me with an upgrade fee at a later date. I had to wait a little longer, but they saved me about 15 bucks by telling me speedo would be MUCH better if I waited a little.

Sorry about that. The post should never have escaped from my hard drive. I marked it as 'held' with Oasis and then was horrified when it got uploaded. However my article has not yet come through on any of the NNTP sites I have checked so I assumed it had not in fact escaped. Obviously posts originating from Demon hit Canada before they hit Demon!

The situation is this...
The software translation is completed... The English documentation is completed (although it is NOT a translation of the original German docs)... The software has been delivered to Denesh... who is due to edit the documentation and then contact TKR to finalise a couple of things.

But horror of horrors:- Denesh is unwell (from working too hard :-) so there is a slight delay with this. Expect the release towards the end of the week.

Or alternatively, there is at least 2 utilities (i forget the names
now) which will convert between 1st Word Plus, RTF, and other formats.
This will retain formatting information and text highlights.

>>2. This question may be part of the answer for above; the present single

You do not need TOS 2.06. You just need any utility which will format
in high density - and there are loads around.
And as for the Ajax chip, there are many users around who are managing
quite well with the WD1772-02-02. Unfortunately my 02-02 is
underspecified :-(

>
>>3. What is the easiest & cheapest way of upgrading memory to:
>>a. 1Meg

The cheapest way is to solder 16 chips, 16 capacitors, and 3 resistors
into certain holes in your motherboard. But I would recommend against
this as when I tried it I fried my computer :-(See below for easiest.

>>b. 2 Meg or more?

The easiest upgrades in my experience are the MarPet solderless upgrades. An unpopulated Marpet Xtra-RAM Deluxe costs £26 in the current Atari World offers page (which I think means Compo). Into this can be fitted 265Kx2, 1Mx2, or 1Mx4 SIMMS. It is fairly easy to fit but if you have a friend who has done it before, get them to do it for you - that way you can blame them if anything goes wrong :-0

>

AFAIK the only way to do it would along the lines of the SPECTRUM 512 art
package. It changes the palette at the end of every horizontal scan line.
This means it can display all 512 colours in low rez but only 16 different
ones on any one line. I suppose you could do this for medium rez but it is
still not a viable solution because you would only be able to have 4
different colours on any one line. I aggree - not possible. You would have to
be in low rez to get 16 colours and have some software to scroll around a
virtual medium rez screen.

Yes.

>b) Where can i get it?

Site:
ftp.demon.co.uk/pub/atari/new

Files:
www.zip
demon-stik-configs.lzh

You need the STZIP and LZH archivers to make use of them.

>d) is there perhaps any other helpfull software for atari users on the
> internet or web?

The Oasis package makes NOS much easier to use. AFAIK that is at the above
site as well.

If you haven't done so already add the newsgroup demon.ip.support.atari as
there's lots of help there in getting the Web browser working.

>

I don't think those dummy books are to bad, its just the wrong people buy them.
People who really haven't the foggiest about computers, but their job dumps them
in it (the tech revolution), means they need to do or use such and such.
Manuals for said programs are bigger and more boring than an encyclopedia. I
think it for these people, saftey nets like this aren't too bad. Its people
with more sense than money that waste their cash on a book that tells
them something they already know that make these books popular (and probably
expensive).

>I love my STe, but to upgrade to a newer computer and get some

>don't do any stupid flamming remarks; unless it's towards Microslop.
>
Un fortuanatly the German ST compats are rather 'High end' we are talking
computers that cost upward of 2000quid, thats a lot of dosh. Atari jag me
thinks ain't gonna sell in the Uk too well, as there is no advertising to
anybody, the only mention the jag gets is in the odd gaming mag (as a review or
just a mention), or in an ST mag, where a lot of people are p*ssed of with atari

for their great computer customer support. You really would of thought that Atari would have learned about advertising ?!!?? hell even I know that advertising leads to sales !!!

With regard to MoneySoft, a huge number of people I have spoken to aren't gonna buy W95 cause they think its gonna be buggy, and want to wait until a newer bug fixed version is released, te he he. Anyway why the hell is an OS taking up 13 High Density disks, compressed ???? GEM, TOS et al manage on 256K !!!!!!!!

> where I can get a program to make such a copy of the TOS operative
> system?

you can use WINX by running it direct from the desktop. I've just done it myself.. not trying to get STonX going per chance, are you? :-)

btw.. the dumptos.ttp program in the archive (which you have) says 'this should work with any version of TOS' .. but, STonX will only work with TOS 2.06. I tried 4.04, and 1.4 as well, but neither would run properly. The emulator works OK though.. I even installed nvdi into it!

279. STiK/CAB...Please Help

Newsgroup: comp.sys.atari.st
Date: 1995-10-07 00:00:00 UTC
From: bjr@EbiCom.net
Message-ID: <455o1h$2dn@Einstein.EbiCom.net>
Source record: 157980

Aloha,
I recently aquired aquired the WWW package from Umich...
I finally got it up and running...but frequently got two bombs.
Later I found a newer version thinking it might be more stable
(1.3 I think) but it's even worse than the first (1.1)...so I put the old
one back up. Now I can't get either one to work at all! I've tried
everything I can think of with both versions...and...no luck. Tried with
and without Geneva...NVDI...even tried it from floppy with nothing but
STiK and CAB in memory. I'm almost positive the slip connetion is being
established properly...CAB just plain doesn't like me I guess.
I'm running an stock 1040 STe with TOS 1.62 and four megs of ram.
The modem is a 144000 Zoom FAX modem. Tried every thing I know to try with
modem setting as well...no compression...slower baud rates...etc...
Even tried a second down load just in case the archives were
corrupted in transit...
Any suggestions?

What is the CD option in the config box for?
Why are there several pointers to HTML folders?
Is it a must to install "Alternate Viewers"?
What Cache settings should I use with 4 meg STe and 32meg HD partition?
I seem to be missing any files that could answer such questions in my
archives :(

Not to be all bitter mind you...
I much appreciate the effort going into STiK...
The one HTML I managed to get shown looked great on my mono screen!
I'm anxious to get addicted :)

Thanks,
Brian

: Giovanni Ciampa (gio@wcl-rs.bham.ac.uk) wrote:
: : Does anybody know of any programs that, given an outline font (any type) and
: : a point size, will generate a suitable GDOS font?

There is a Package by Mega Type Called Bit Maker that can do this...
Here are the package Bullets

* BitMaker allows you to create bit mapped screen fonts for Pagestream
1.8x and 2.1 from .DMF printer fonts, or create .ABF screen fonts for
Pagestream 2.1 from Type 1 printer fonts. Speed up screen redraws
drastically!
* GDOS fonts for screen and any printer can be rendered automatically
from Pagestream .DMF fonts. Users of GDOS programs such as
Publisher ST, Word Up, Microsoft Write, or East Draw can now access the
vast library of fonts previously not accessible.

With a few cliks of the mouse, BitMaker will render the font for
you, at any of the following sizes:
* Pagestream--12,18, and 24 points can be created.
* GDOS--any user selectable size or resolution can be created.
No work on your part are needed to use the resulting font,
although the human touch may be needed at smaller sizes for best results.
GDOS fonts can be created from Calamus fonts if first converted to .DMF
format using Font Verter. GDOS can also be converted from Type 1 fonts
if first converted to .DMF format using the Type 1 Converter / Fontverter
combination.

Bit Maker, Type 1 Converter, and Fontverter are Distributed by:
Mega Type
P.O. Box 645
S. Bend, IN 46624
Tel:(219)288-7468

Toad Computers Also keeps these Font tools in stock...

291. How To Run Atari Games On PC

Newsgroup: comp.sys.atari.st
Date: 1995-10-07 00:00:00 UTC
From: kirkc@azstarnet.com
Message-ID: <456nmv$eek@news.azstarnet.com>
Source record: 157992

I would like to find out if there is an emulator package which will run Atari games software on a PC (486/33). A woman who works for my wife has been using an Atari for several years and has a significant collection of games software. She just recently purchased a PC which I installed for her. The hitch is that she has a rather severe learning disability and would like to play the games she's used to from her Atari. It has taken quite some time for her to master the rules and procedures for her games, and I told her I would check to see if there was some way we could get her old games to work on her PC. It looks as if all of her games software is on 3 1/2" disks. Please e-mail or post here. Thanks in advance for your help.

I would tend to agree with Roland, the limitation is in the Shifter chip.
The chip can only access four palette registers in Medium res mode.

There is a hardware mod floating around (called 32Kcolor, or something
like that) which gives 32 colours on a low res screen. I suppose it might
give 8 in medium res.

The instructions are not complete however, & you need a second shifter chip.

> instead to purchase SCSITOOLS from Germany!

I've recently been connected to Mausnet also. My German isn't very good, but
I've seen this too. It seems that you have to use SCSI-tools from Hard&Soft,
which handles the arbitration, but you have to boot from another hard disk to
be able to use the Fireball - it can never be used as the only drive in the
system. I haven't tested it myself, but in these German discussion groups it
seems that people have got it working ok.
However, since it needs a special setup I find it better to avoid these Quantum
drives if possible.

Best regards,

Claes

>Have you thought of installing a minix file system to stuff your html
>copies into?
Yes but only for a passing moment :)

I don't see how a minix filesystem is going to help HTML resolve links to
URLs. I've taken this typical list of links from a page at the birthplace of
the web:

<UL>

A list of
available W3 client programs

Everything about the W3
project

Places
to start exploring

</UL>

The HTML docs say it works under TOS file systems, and it does handle .html
extensions as .htm - but it seems to offer no way to support URLs :(

Perhaps there is a new version with a translation table ...

Well at least netscape stops its asteroid thing when its not getting any info
but seriously.. this probably takes up soo much processor time would you rather
have this taking up space/slowing the machine down or just the box saying Ive
got this much of this file..

: 2 DSDD Disk Drives. Can someone tell me where to get SoftWare to do this
: easily for my Atari ST on the InterNet!

You don't need any kind of software to be able to make pages. All you
need's a small manual on learning HTML, and a text editor. Very simple.
If you want to search for some online tutorials on learning HTML, go into
Webcrawler (http://www.webcrawler.com) and search for the words "HTML
tutorial guide" and you should get back tons of pages that contain
tutorials on HTML (there are many). It's quite easy to learn -- if you
have patience, you could learn it all in a week, even if you know
nothing about programming.

DISTRIBUTION: Business Editors/Computer Writers

LENGTH: 841 words

HEADLINE: Jean-Louis Gassee unveils The BeBox; First product of Be Inc. delivers
a powerful alternative to traditional computer platforms

DATELINE: MENLO PARK, Calif.

BODY:
Oct. 3, 1995--Be Inc., the company founded by Jean-Louis Gassee, former president of Apple Computer's product division, today launched its much-anticipated first product: The BeBox.

The BeBox is a high-performance, low-cost system designed to meet the demands of sophisticated computer users and developers who are frustrated by the
limitations of current architectures.

With its combination of powerful hardware, an innovative new portable operating system, and a host of advanced sound, graphics, video, and communications capabilities provided by Be and third-party partners, the BeBox is poised to become a significant alternative platform for next-generation applications.

It is the first true real-time, object-oriented system that features multiple PowerPC processors, true preemptive multitasking, an integrated database, fast I/O, and a wide range of expansion options -- all at an extremely
affordable price.
The BeBox enables users to run multiple compute-intensive programs simultaneously, synchronize music and sound, view and edit videos, and access the Internet -- all at the same time. It includes a full set of software development tools and technical documentation, and features a built-in database that is accessible at all times, so users can continually store, retrieve, and update key information from multiple sources.

No other product on the market can equal its performance in its price range.
The BeBox is also an excellent system for classic applications, video games, and
personal productivity tools. The combination of these features makes the BeBox particularly attractive to the fast-growing A/V market -- currently valued at more than $ 7.3 billion by Dataquest -- as well as to technology enthusiasts and

hobbyists.

"The BeBox brings the benefits of new processor and software technology to markets that are exploding," said Gassee. "Older computing architectures cannot
match its capabilities at this price point. They carry too much baggage and can't effectively incorporate innovations. The BeBox provides a fresh start at an extremely high technical level. It's a system that has already excited developers and captured the imagination of our customers."

The BeBox takes advantage of industry standards, including support for PCI and ISA cards as well as IDE and SCSI devices, making it easy and economical for
customers to tailor systems to their needs using components from the "PC clone organ bank," including monitors, keyboards, memory, hard disks, CD-ROM drives and modems.

"The BeBox exposes the exciting to the excitable," said Gassee. "It's a fresh architecture that lets developers do what they couldn't do on other systems. It provides an opportunity to get innovative applications to market and to establish a leadership position on an emerging platform.

"We're a young company, so we're eager to facilitate developers' efforts. We provide outstanding development tools with CodeWarrior for Be, and we're licensing our technology to manufacturers, integrators, and software developers."

Be has already established strong alliances with American and European companies that are developing A/V and telecommunications products as well as personal productivity applications.

The BeBox is the first member of the Be product line, which is being expanded to include four-processor and portable configurations. Be products will also incorporate future versions of the PowerPC processor. The hardware and operating system technology is open for licensing, expanding the possibilities for further added value.

The BeBox will begin shipping to selected customers and developers in mid-October, 1995. The suggested U.S. list price for a basic system is $ 1,600,
which includes the CPU board, the operating system, an I/O card, CodeWarrior for
Be development tools, a system case, cables, and technical and user documentation. The BeBox will be sold directly by Be as well as through selected resellers, value-added resellers, and systems integrators.

About Be Inc.

Be Inc. was founded by Gassee in 1990 to overcome the limitations of existing computer architectures. With a team of industry-leading engineers and business executives in the United States and Europe, the company has positioned itself to become a key player in fast-growing application markets. Be Inc. is headquartered in Menlo Park. -0-

> : recording? Surely you need more than 256MB?

Only if you want more than 25 seconds of sound! (The figure I can recall being told is "ten megs per second in CD quality stereo").

Assuming that 256Mbytes per partition was true, using TOS 1.0, which will only allow you to access drives A: to P:, giving you only fourteen hard drive partitions (C: to P:). At 256Mbytes each, then you can only go to 3584Mbytes (3.5 Gigs).

TOS 1.2 extended this, to allow you access to all drive letters up to 'Z', so that adds another ten partitions (2560Mbytes = 2.5Gb), to give a total of 6Gbytes.

The (dagnabbit!) file selector on TOS 1.4 and upwards only allows one to click on drive letters up to P: (MultiTOS AES 4.1 has a popup menu in the file selector that does allow you to go to Z: - nice one guys!. Pity the shipping version of MTOS still has AES 4.0 with the old 1.4 selector)

Unfortunately, GEMDOS hard drives only have room for four partitions in the bootsector of the hard drive. Making one into an extended partition, and encompassing many smaller partitions into it, one could in theory go to a lot more than the one gig that this would otherwise limit you to (four times 256 = 1024Mbytes = 1 Gbyte).

> Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS
> version if I remember rightly, and BGM, AFAIK, can always be anything up
> to 512MB. There is no way to go over 512MB, except perhaps an alternative
> filesystem.

A standard GEMDOS partition is limited in the number of sectors (or clusters of two or more sectors, depending on the TOS version) to either 32k=32768 (TOS 1.0) or 64k=65536 (TOS 1.2+). This limits you to either 32768*512=16777216=16Mbytes or 65536x512=33554432=32Mbytes using sectors - clusters would increase this somewhat, at a cost of wasted space when storing small files. Using a cluster size of 2k (four sectors times 512 bytes equals 2048 bytes equals 2k), and limited to 64k clusters, this gives you 128Mbytes (134217728 bytes). At a cluster size of 32k,

you have 32768x65536=536870912=512Mbytes, with 64k-sized clusters this doubles to 1073741824 (1 Gig)

The next step would be to increase the sector size from 512 bytes.

> And, AIUI, under MiNT you can have drive letters all the way to Z, so a
> 9gig drive (18 partitions @ 512MB each) should work fine as long as you
> run MiNT.

According to the Compendium, "A hard disk may have up to four standard (GEM or BGM) partitions or three standard and one extended (XGM) partition. The first partition of a hard disk must be a standard one". (pg 4.16)

It also displays a table giving the layout of a partition table.
GEM partitions are under 16Mbytes in size.
BGM (Big GEM) are 16Mbytes or larger.
XGM are extended partitions

No qualification in that table was given as to what the differences are between XGM and the other two.

For that, one must read the two paragraphs below the table, labelled "Extended Partitions".

The hd_siz value in the boot sector of a hard drive is a 32-bit value giving the number of 512-byte sectors on the physical device. Therefore the drive can get to 41 (512=9 bits, 32+9=41) bits in size (Two Terabytes) theoretically.

(Just a few rambling thoughts from a overtired brain)

What? 16 bit samples, 44.1 thousand per second, 2 channels = 176 400 bytes
per second. Now back to the main topic...

Form support is definitely my choice for priority for the next update!

: >Maybe a cool 3d moving icon in the upper right corner too :)

Actually, I hate those animated icons. They bug me. Besides, I'd rather have some sense of what is going on (as Mosaic does), and CAB's descriptive status messages are the best I've seen yet. I do wish those messages went in the infor. line of the window instead of in a dialogue box that appears in front of the window. Inpatient twerp that I am, I like to click on a link and then continue reading while waiting for the data to flow in the background. Which reminds me, as long as CAB is formatting the text and converting the pictures as they come, why not start displaying them then too. Build the page up element by element as they come in (as those other Web Browsers we won't mention any more do except to say I like CAB's cache system better than theirs too).

308. Browser HELP!

Newsgroup: comp.sys.atari.st
Date: 1995-10-08 00:00:00 UTC
From: a2124874@athena.rrz.Uni-Koeln.DE
Message-ID: <4577ds$nhd@news.rrz.uni-koeln.de>
Source record: 157911

Thanks to everyone who answered to my request of a STiK ftp site! So now
i have installed everything and ... IT DOESN'T WORK!!!

I have intalled STiK and that works, i can connect to my provider. But
when i start the browser and try to get a web-page via the Cool-Browser the
message "resolving host" appears, then, about 10-20 sec. later, two bombs
appear and that's it!
I have no idea, why it doesn't work the way it is supposed to
work! And yes: I HAVE installed the CACHE File on a partition.

Also, i have no guess, where to find the external viewer,
mentioned in the path-file menue of the browser?!

I'm grateful for any help from yours!

Thanks, Andreas

309. Is there a fix for malloc difference between TOS1.6 & 2.05?

Newsgroup: comp.sys.atari.st
Date: 1995-10-08 00:00:00 UTC
From: oskelton@cix.compulink.co.uk
Message-ID: <DG40p5.LwF@cix.compulink.co.uk>
Source record: 157912

I would like to be able to run Antic's Base2 database on Tos2.05 and later, but it crashes. It seems it is making a malloc(0) call. I am told this is for garbage collection, and is an illegal call which doesn't work on later TOSs.

This difference between the two TOSes may be the main change which requires people to fit TOS switchers to TOS upgrades.

I was wondering if their was any small software patch to fix this.. or whether there is an easy way to patch the binary so it will run in later TOSs.

Cyrille Dupydauby's excellent Backwards program does make a patch for this, but I think it is designed to fix games and is not so practical for regular 'business' use where one doesn't want to lose too much memory. In any case, I mainly want to run Base2 on a MSTE and not a Falcon.

I suppose perhaps even Magic or NeoDesk solve this problem.. but I suspect not.

310. STiK/CAB-HELP needed!!!

Newsgroup: comp.sys.atari.st
Date: 1995-10-08 00:00:00 UTC
From: a2124874@athena.rrz.Uni-Koeln.DE
Message-ID: <4578c4$o5n@news.rrz.uni-koeln.de>
Source record: 157913

Help! I have installed STiK and the Cool-Browser by A. Clauss but the last one doesn't work! Whenever i try to get a htlm page, the message "resolving host" appears and after that, about 20 seconds later, two bombs! Then, the CACHE-file has obtained some more sub-files but not the htlm-page (well, there is in fact an INDEX.HTM with 0 Bytes!)

Any ideas?

I'd be grateful for any help!

Thanx, Andreas

: Thanks to everyone who answered to my request of a STiK ftp site! So now
: i have installed everything and ... IT DOESN'T WORK!!!

: I have intalled STiK and that works, i can connect to my provider. But
: when i start the browser and try to get a web-page via the Cool-Browser the
: message "resolving host" appears, then, about 10-20 sec. later, two bombs
: appear and that's it!
: I have no idea, why it doesn't work the way it is supposed to
: work! And yes: I HAVE installed the CACHE File on a partition.

: Also, i have no guess, where to find the external viewer,
: mentioned in the path-file menue of the browser?!

: I'm grateful for any help from yours!

: Thanks, Andreas

It took me a lot of experimentation, but it seems too work for me now,
That is, it takes some time before it bombs on me!

Although it depends also on the URL's you try, it seems.

Are you sure that you're host is expecting slip. I found out be doing
the same commands on a terminal emulator.
Does your host give you an internet address?

BTW, what kind of Atari are you using?

Henk

Get UNITERM, it has Kermit, X-modem and Y-modem and with some trick you
can use Z-modem as well.

I just recently picked up STiK. I've read over many msgs with people talking about problems they're having, but no one has hit on my problem that I've read so far.

Stik calls and runs through the login for me. I connect and then the accessory box just disappears. So I'm sitting there at my desktop connected and there's nothing I can do.

I'm attempting to use this with TIA and I read in here that someone said they don't think TIA works with Stik. So what does work and where can I get a copy of it? I also need a later version of Stik, so where do I find that? And if Stik is dialing out w/o the fixes in HSModem 6, do I still need it? If so, where do I get that file?

Could someone tell me what's supposed to happen when you connect with Stik? Does a window open up for you to enter text online, or what?

Does anybody know where I can get a printer driver for my Roland 2417 (which can emulate an Epson LQ). I'm using 1st Word. (And I don't know if this matters but I access the internet with a Windows machine.) Thanks!

320. Is the Atari SCSI format really EDSI encodiing?

Newsgroup: comp.sys.atari.st
Date: 1995-10-08 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DG5BL6.FFK@freenet.carleton.ca>
Source record: 157923

The Atari ST uses a different format for encoding hard drives than
either the IBM or the Mac (I think). As far as I am aware, Ataris
also don;'t seem to be as picky about drive termination as the preceding.

I have wondered it the Atari SCSI format is the same as the ESDI encoding
(for IBMs) which was used up until 4-5 years ago. I believe that there
were even ESDI drives (for IBMs) which featured 50 pin SCSI-like connectors.

Does anyone know the answer to this? Any relevant info wil;l be appreciated!

Regards,

Keith M.

Well, I gave up on TIA and got a copy of slirp. So, now I'm getting the IP address. So I'm connected. What now? I run CAB, try something from the hot list and I get "Revolving" and then some sort of file error.

Am I correct in assuming that the hot list are already set up and I should be able to just click one and it will connect to the web site?

If I sound like I don't know what I'm talking about, that's becaus I just discovered all this stuff yesterday. :) I've been using th non-graphical lynx for awhile now, but I know nothing about the graphical end of this.

Thanks,
Mark

Where can I get a complete list of Atari newsgroups? I'm after something where I can get hold of technical documentation and protocols. Surely Atari have released their developers documentation for free? I've got to that stage in programming where it's lack of documentation on the newer features that is holding me back.

Also I need to be able to convert the Magic 3 object library to Mark Williams object format. Can anybody help with this - even an email address where I can contact one of the MagiC authors would be much appreciated.

Thanks

Yep, STarCall. It's available via ftp from iinet.net.au in the
pub/atari/comms dir. It's the current ENGLISH (92% anyway) soon to be
updated.

The easiest and best fully 'GEM'ed' S/W comm's available for the ST (IMHO
that is).. here are some of it's features

- Display in windows or fullscreen
- ANSI-compilant, all attributes incl. blinking
- Grayscale emulation
- GEM-Desktop with shortcuts
- Many fonts in different sizes useable with and without GDOS.
- Batch programming language
- Buffer management , quotes
- Moduls for protokolls and tools
- Moduls for FAX, Voice and a full BBS
- fast editor with many tools
- VT52,100,102,200,Ansi with autoswitch.
- List of numbers with individual setup
- Logile for telehone costs
- Passwort protection.
- Fullscreen-Chat
- Online-Help
- many extras like disk format, info, etc...
- MULTRIX, Multitasking-Tetris for fun

System configuration:
^^^^^^^^^^^^^^^^^^^^
To run STarCall you need
- ATARI ST/STE/FALCON or compatible.
- min. 1 Megabyte Ram
- Monitor (best with mono)
- Modem
- Harddisc or 2 Disk drives (or ram disk)

I think this is good advice for all of you that cannot get STiK working:
Print out your version of dial.scr.
Then login with a terminal emulator and check the script by looking if the
right prompts appear and typing in the responds. This should bring you
to the slip-connection and give you an IP-address.

In my case I had to skip the first lines, change a few in spelling or wording
and insert a waiting for the prompt ($ in my case) and giving the command
'slip'. Then it started working (that is connecting went well).
Then when SLIP works you can have lots of problems with CAB as well.
In any case use an existing CACHE-directory.

I hope I helped a few of you with this!
Would be nice to hear if so!

Henk

Date: 1995-10-09 00:00:00 UTC
From: Szymon Stasik <stasik@bull.mimuw.edu.pl>
Message-ID: <Pine.BUL.3.90.951009101028.27327A-100000@bull.mimuw.edu.pl>
Source record: 157854

So any new info about MicroBox?
I know it exist, I even saw the foto (not raytraced :) with minitower and
a keyboard seems similar to TT keyboard.
So if any has more info please do write!

Simon.

>
Uhmm... actually spec 512 changes the palette 3 times in every scan line,
that does not give 16*3 colours in each line, as one could guess, but
only 14*3 plus black - as index 0 is always set to black and index 15
reseved for forground (mouse pointer).

I have tried to use a routine to display spec 512 pics in medium res, but
as I at most could get 3*3 colours per line (I cheated and used
the forground color), it didn't work for most of the 16 col pictures I
tried to convert.

Source record: 157856

The other day while browing though STf or the other one, I noticed an
artical about an ST emulator for unix machines.

It had a picture of an Xwindows desk top with Grav running in a window.
I think it said it was for solaris machines.

Can some one provide details/ftp/www???

348. Informal Survey on ST Mono Monitor Longevity

Newsgroup: comp.sys.atari.st
Date: 1995-10-09 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DG6y85.Iyv@freenet.carleton.ca>
Source record: 157865

Here in our local ST community (as I believe is the case elsewhere) used ST colour monitors are common but monos are SCARCE. In accounting for this, several people I know have suggested that the colour units keep going like the energizer bunny while the monos have a higher mortality rate. I tend to believe this myself, since I know of half a dozen cases of mono mortality and no cases of colour crap-out.

My view is based on an admittedly small sample size. Perhaps, in an effort to resolve this issue once-and-for-all people could advise me(by email) of their experiences with Atari Monitor expiry (specifically whether your now defunct unit was Mono or colour and preferably what model it was).

I'll tally the results and post my findings to this newsgroup; perhaps for all time resolving one of the great mysteries of the universe.

If you care to participate in this survey, kindly send me an E-mail (to cb092@freenet.carleton.ca). Please don't post to this Newsgroup since I don't have time to cull the results amid the many unrelated posts. Also PLEASE DON'T SEND ME AN E-MAIL SAYING THAT YOUR MONITOR IS STILL WORKING. IF I DON'T HEAR FROM YOU, I'LL ASSUME AS MUCH.

Many thanks,

Keith Murchison

> preceding.

Ataris do use a different hard disk format to that of PCs. Its similar -
but only compatible in rare and specific cases (like the first partition
if under 32Mb). In entriely incompatible with that used by the Mac.

They are less fussy about termination - though only because Atari SCSI
buses are relatively slow - as are most of the SCSI drvices fitted. A TT
or Falcon using a modern fast drive will require termination just like any
other SCSI based system.

> I have wondered it the Atari SCSI format is the same as the ESDI
> encoding (for IBMs) which was used up until 4-5 years ago. I believe
> that there were even ESDI drives (for IBMs) which featured 50 pin
> SCSI-like connectors.

I don't think Atari SCSI has anything to do with the ESDI standard. If both
had a 50 way IDC connector then its pure conincidence - as the drives used
by Ataris are standard SCSI ones.

>> "real" hard disk partitions. (C-Z without U.)

>Can you explain the difference between a BIOS drive & a GEMDOS drive?

BIOS drives can be accessed using BIOS system calls. Typically hard disks,
floppies and RAM disks are BIOS drives. They can also be accessed using
GEMDOS, of course, because GEMDOS itself uses BIOS calls for this.
GEMDOS drives (e. G. the MiNT drive U: or CD ROM drives) cannot be accessed
by the BIOS but only by GEMDOS system calls. BIOS and GEMDOS are different
layers of the operating system.

>What is the partition size limit for Macic 3?

1 GByte for each partition. This is independent of the TOS version you use
because MagiC replaces the entire operating system, not only certain system
calls.

>AHDI software can partition up to 24 partitions if I remember rightly
>(per drive), so I should think you wouldn't have any trouble with this.

I'm afraid you're wrong. AHDI doesn't support more than 14 partition, i. e.
drives C up to P. There is no relation between the number of drives. HDX
allows to partition with more than 14 partitions (there is no upper limit
for the number of partitions at all) but this is not the same emount of
partitions most hard disk drivers support. For the present being more than
14 partitions (C up to Z, without U) are only possible with the combination
of MagiC 3 and HDDRIVER.

>I would have thought that if the number of partitions went past P, the OS
>would automatically carry on past P. I guess you just have to experiment.

No it can't because the memory TOS uses for buffering partition data is
statically limited to 14 partitions. There is no way to get this limit
lifted under TOS.

>When you say you're unable to "define" drives between P and U, what
>exactly do you mean? I've been able to use drive R, as I mentioned above,
>and I have made aliases to X and so forth from drive U with no trouble
>(using the mint.conf alias command).

But these drives only exist on the GEMDOS level, not on the BIOS level. Hard
disk partitions are BIOS drives.

Concerning TOS 4.0 (and MagiC, of course) it is generally accepted now that
1 GByte works. On the Falcon a lot of people use partitions > 512 MByte for
hard disk recording.
Even 2 GByte partitions seem to work because TOS seems to allow an overflow
in the BPB sector size field, i. e. 0 bytes per sector are taken as 65536
bytes per sector. But I don't think you should use such partitions sizes
because this is clearly beyond any specification.

The problem is that with MagiC you can have 23 partitions, indeed, but you
can't have a MinixFS with MagiC. And without MagiC you can't have more than
14 partitions. This can't be solved unfortunately as long as there is no
MinixFS for MagiC 3. It looks as if there never will be one. At least I
never heard of somebody working on this.

>Does anybody know when HD Driver 4 is out?

In Germany it has been out for several months and in about two weeks
HDDRIVER 4.5 will be available. As soon as MagiC 3 is available in the UK
the English version of HDDRIVER 4.5 will be available in the UK, too.
Both programs are distributed by System Solutions.

>(logical) floppy drives.

I was aiming at the restrictions no in the drive bit vectors but in the rest of the operating system. TOS simply can't handle more than 16 BIOS drives because the TOS memory model is layed out statically for only 16 drives. That's the main reason why more than 16 BIOS drives won't work with TOS. At least I guess it would be easier to patch TOS in a way that it can handle more than 16 GEMDOS drives than to get more than 16 BIOS drives working. But in any case the restrictions should be clear now. There were quite a lot postings on this subject.

364. Atari Mega2 Questions (if only i knew about diz machine!)

Newsgroup: comp.sys.atari.st
Date: 1995-10-09 00:00:00 UTC
From: fivepin@passport.ca
Message-ID: <45c0th$91c@diplomatic.passport.ca>
Source record: 157881

Heya all... I've a Mega 2ST i've been using for MIDI for years (awesome machine) but it's in need of help - wondering if i can get some questions answered...

I NEED A NEW MOUSE! Can i use a PC one? where can i find a Atari one? etc etc.

Can i use a PC monitor? I've a mono monitor, but it's not great on the eyes - if i could hook up something like my ASTVision 7L or an NEC MultiSync II id be a happy guy - is this possible?

I've a Supra 20MB external HD - the HD itself is dead - thermal problems. How can i get a new HD for it without replacing the case, or does it matter, and what is the most cost-effective way to do this? 20MB or so is fine, i'd like something cheap and reliable.

Did i hear something about speeding up the MIDI ports on the ST? I've got a Steinburg Midex (midi expander) on the unit, and wouldnt mind accellerating it.

What is the scoop on file exchanging between the Mega and my PC?

Can i add the "blitter" chip to this machine to speed up graphics (screen redraws are slooow)?

LASTLY - What is the newest TOS and how do i get it?

Thanks for your help - pls email your replies to me as i don't have a whole bunch of time to peruse newsgroups and my ISP kills off newsgroups afeter a couple days.

Sorry to say, but you also missed my point, it seems..

: never designed to be one. That's like saying that Kandinsky should have a comprehensive
: installer for GDOS included with it - don't be ridiculous.
:
: > Or are Internet-services on Atari platform meant for "pros" only.. ;-) ?
:
: No - but they are meant for people who deserve them (evidently not this guy).

This guy thinks he deserves them as well as anybody else. But there's this one thing that makes me angry, too. Very often, when someone who's not familiar with computers goes and asks some silly question from someone who knows "a lot", this "expert" only gets mad: "don't be an idiot, OF COURSE xxxx should be xxx - and please, read the manual before asking silly questions!".

This wiser (?) guy just doesn't understand that some people don't even know where and how to begin "getting help"... When you don't understand one xxxx bit of what you see, you easily get frustrated - and do something silly...

Everybody's a beginner in SOME things, you know. Programmers have to accept that, I think - even if they don't like to write something "almost everybody knows..". Your attitude doesn't sound very pleasant to me, if you really say that problems with MiNTnet are not your problems... Do you disagree?

I have enough experience with Ataris, since 1986. But MiNT isn't my "strong point" - and when I spend hours and hours trying to get something to work, reading the instructions over and over, getting finally nothing done... That makes one mad!

Sorry if I sound a little narked here, people who know me will know I'm usually
: happy to help, fix bugs, even do over the phone step by step tutorials.
: But I do get annoyed when someone posts slating my software as obscure & difficult to set
: up without having the courtesy to mail me first for a little help, before making
: me out to be some sort of elitist who makes my software obscure on purpose.
:

Please, calm down! Because 1) I think your program seems GREAT to me!!! and 2) I only complained that with instructions provided, I could not get this great program to work! What do you do with something that looks great but refuses to work, no matter what the reason. Very little, I think..

And I don't think that people generally send e-mail to authors of the programs when they have some trouble. They ask help from others, or just yell their frustration out. I guess I

did that, but we're all humans, aren't we?

I do respect your work, and don't want to put DUftp down. Still I think that if even experienced Atari-users (I am one, after all) have trouble when trying to install some program, then the documentation simply isn't good enough.

You may say that I'm too stupid to use programs like DUftp. Perhaps I am. But will you divide us, your "customers" to clever and dumb people and say to anyone who's having trouble with MiNTnet: "if you can't install it, it isn't my problem...". It _is_ your problem very much, if you want people to use your program, I think.

Please, stop thinking that DUftp is only something for experienced MiNTnet users. We all need a good ftp-program. We "others" just need MUCH more help and information.

Sorry if I insulted you - wasn't my meaning.

: Get help first - then winge if you need to.
: (My mail address is plastered all over DUftp, even in the about dialog)

OK.

The paths, are the thing that are causing the problem. Spend some time checking that any external viewers, such as Gemview, Imagecopy for graphics, a small text editor et al. are actually being pointed to, or if you haven't got one, then make sure the box is blank.

Also check the source path at the bottom, this HAS to be pointing to one of your drives, and not a partition Q: or P:, if the box goes blank when you move it to your own drive (don't bother selecting a program, just make sure its the right path and select Ok), don't worry, it should be fine.

That should help.

I had a look at the Stik docs and it seem very complicated. The postings here hasn't helped much. Now I think Stik is a program that's need on the ST and many dedicated ppl are trying to iron out the bugs. But being I only have a 2400 modem(for now) and only a college account which is just UNIX, I have a corker of an idea that is an alternitive to SLIP.

How about a front-end shell for the ST that dials in the number, logs on, and replaces the prompts and commands(from the user's perspective) with the type of windowed interfaces they have for Windoze and XWindows? It will be fun trying to get a graphic web browser out of Lynx :)
As soon as my programming skills are up to brush, I'll try to knock up something like this.

> I'm new new to the net and I'm sure that this is pretty much a beaten
>horse!

Yeah, that's pretty much it. But drz, Radak, and others(I used the IRC names) are supporting Stik. That's moer than what I can say about that "other" software company.

Phil, I don't really want to beat a dead horse with this topic but
you did make some very good points.

>I know a chappy whos a salesperson in a PC retailing shop.
>He knows a bit about PCs, but really no idea of what Win95 other other
>bits are needed et al.

It's like that all over, but the only person I know who is familuar
about Win95 is Bob Chopick. He owns a computer store and he had the
Final Beta running while the "chain" stores only had the old Windoze
on their Windows 95 display(Go figure). He builds the best PC's and
he sold me my STe a few years ago. My point is that computer sales
ppl should know so much about the PC's like he does.

>I don't think those dummy books are to bad, its just the wrong people
>buy them.
>People who really haven't the foggiest about computers, but their job
>dumps
>themin it (the tech revolution), means they need to do or use such and
>such.
>Manuals for said programs are bigger and more boring than an
>encyclopedia. I
>think it for these people, saftey nets like this aren't too bad.

I have nothing against "Dummy" books, in fact Internet For Dummys has
really helped me alot getting on-line. My beef was with the way
computers are set up, ppl feel stupid. Imagine driving a car and you
feel imtimdated because you're not a mechanic and you think of
yourself as stupid(Certain car mechanics use this to rip them off).

>Its people with more sense than money that waste their cash on a
>book that tells them something they already know that make these
>books popular (and probably expensive).

Maybe reading articles in Atari magazines have spoiled me b/c they
don't treat you like an idiot or major guru :) Wish they have stuff
like that in the PC world.

>Un fortuanatly the German ST compats are rather 'High end' we are talking
>computers that cost upward of 2000quid, thats a lot of dosh.

'bout a same price range as a P90, but they should bring back home
computers that are $400-$500. The STe was perfect for this reason,
maybe someday the PC can be built as a gaming consol and you can add
inexpensive parts to do as much computing as you need. (PC's now are
just plain overkill)

>Atari jag me thinks ain't gonna sell in the Uk too well, as there is
>no advertising to anybody, the only mention the jag gets is in the odd
>gaming mag (as a review or just a mention), or in an ST mag, where a
>lot of people are p*ssed of with atari for their great computer
>customer support. You really would of thought that Atari would have
>learned about advertising ?!!?? hell even I know that advertising
>leads to sales !!!

We Atarians here in the States knew that for a very long time.

>Anyway why the hell is an OS [like Win95] taking up 13 High Density
>disks, compressed ???? GEM, TOS et al manage on 256K !!!!!!!!

PC ppl not everything half-bent backwards but also hog up all
availble space. We get faster Intel's, more memory and bigger HD's
because Windoze keeps on sucking it up(would you believe 8Mb is no
longer good enough). Compair to game coding on the consoles(and ST's)
this is very sloppy! I don't believe that Microslop will ever
succeed in the game market unless they take other ppl's games and
publish them themselves.

I once KM-Term which is a very good PD program(I only moved on to STalker b/c it handles my needs for school.) It handles ANSI very well and once you figure out the configure file(not hard) then you can customize it to your needs. The only propblems I had was I couldn't get the Z-Modem access to work(could just be me) and for IRC I can only use ST-Term which is also a good program just for general chatting and bull.

Any PD that you need just go out and get, there are lots. Try Hensa archives or Umich FTP site. I myself collect games :)

You're sadly right, most of the good games do not really on the OS. It boots straight off the boot sector and that's it. There are some games written in Gem that should work(like Acctris) but I'll have too see about this when I get my 486/Gem 4.0 setup.

You can tell the person to just pick up a 2nd-hand ST(or STe which is better) and just use it to games. A TV is just suitable enough for games.

[Reading the text files that go with the games on a TV is a witching pig, hopefully when I'm more famuliar with C programming on the ST I'll try to write a text viewer that works with low rez :)]

Hi, all. I'm hoping you can help me.

Back around 1989 I got a MEGA ST2 computer. We're talking 720K Atari disk drive (SF 314 model) here, etc. No Hard Drive. The system worked really well for me, though, and I did a lot of good work with it.

Now I have a Macintosh with an HD (1.4 MB) drive, and I'd like to transfer this good work over. But I can't. I have MS Word macros that will fix the formatting codes etc. in WordWriter ST .doc files, that's no problem. The problem is geting the files transferred in the first place.

You see, neither Mac nor DOS drives that I try will read Atari-formatted disks. Both just reject them as unsuable, while my Atari drive won't take Mac or DOS disks, either.

I should note that the Mac and DOS computers I've tried WILL take a 720K DOS disk, so that isn't the problem. As the man says in 'Cool Hand Luke': "What we have here is a failure to communicate."

Any help any of you can offer would be deeply appreciated.

What you've found is the (in)famous DOS-bug. AFAIK the DOS-
manual says one thing and DOS does another. The problem is that
TOS and DOS disagrees about a couple of fields in the bootsector.
This has been fixed in later versions of TOS. My guess is that
you are running TOS 1.02 (originally fitted in the MegaST). The
fix was introduced either in v1.04 or 1.06, I'm not sure.

There are three solutions to your problem:

1. Get one of the free programs that will let you write a
DOS-compatible bootsector on your existing disks.

2. Format a couple of disks on your DOS-box and let your
Atari transfer the files to them. With only one drive this
could easily become quite tiresome. Anyway, your Atari
should have no problem reading/writing a true DOS-disk.

3. Connect the TOS and DOS-box with a serial line and
download the files at 19200bps!

Hope this helps!

I'm using Jekyll 1.38 on my STe, no problems :-) but we can't get it to
work with any Falcon. Have you?
Is 1.38 the latest version?
Is the author, Vincent Partington, on the net?
Thanks,
Julian.

I just found v 1.06 alive and well in umich archives. It
has changed html.app into cab.app, has a new hot list,
including a home page for STiK. It seems to run well
on my system. They also have 1.01 and 1.04, if anyone is
interested.
Does anyone know if one cabn download in STiK? Files seem to be
downloaded, butn they only display incrazy text.

Depends entirely on your machine. If you want to use normall screen resolutions
and pallete restrictions then get Gemview (currently at 3.15) or if you can view
in low res then get Spped of Light or Photochrome which allow more than the
normall number of colours on screen. Photochrome is far beeter but is not very
good for pictures bigger than the screen. They SHOULD be available from umich or
hensa, but i'm not too sure about the latter 2.

Wow! It's up and running. Now I want sound. I tried configuring
a few WAV player programs with CAB, but none of the one's I have
like to be called as a player from CAB. Anyone else had any
luck, I really wanted to listen to the CNN article on the AZ
train wreck. :(.

Falcon 030 TOS 4.04
In Auto (for STiK) is FPatch2, drivn.prg, scc.prg
Only problem I had was with the dialer. One I logged on (VT52)
to my provider and cut and pasted the prompt's and required
responses, I was able to connect correctly. I'm using the Apex
Media gif and jpg viewers for pictfiles and they seem to
get along ok. I didn't have to mess with the TCIP settings,
only adding my providers address, change port (baud) rate and
personal preferances. DeskTop is 640*480/256 (looks bitchen!).

I'd like to do
>more with it.
>
>Could someone answer the following questions:
>
>- What is the standard memory that the 520 came with and how far
can I upgrade
> it?

The 520ST omes standard with 512K of memory and you can still
find 1, 2 or even 4MB upgrades ifg you look around enough.

>- What is the standard DOS that came with it and where can I get
a copy

The standard is GEM which is the OS you SHOULD be seeing when you
boot it up (the desktop.) It can use older versions of PC DOS
when you run an emulator such as PC-Ditto. But it is not by
nature a DOS based machine.

> (I'm assuming that there is something more than the GUI that
boots up from
> ROM)?

The OS you see is what it runs.

>- Where can I get a hold of the manual(s) that was packaged with
it?

Don't bother, they really arent of much use. You learn more by
just playign with it. But you could write atari if you really
need to.

>- What sort of programming languages are available for it?
(Assuming most of
> popular ones such as C, Pascal, os-9, Fortran, etc.....)

There are several C and pascal programming languages which were
writtne for it but remember it is a 68000 based machine and your
best best is to contact some european sites since I think that is
the only place left where you can still get software for it.

>- Is there a good VT-100 term program (commercial,
share/freeware) and is it

Check out "flash" its a very good terminal for the ST if you
dont need color which with the SC monitor you dont.

> possible to use any type of external modem (assuming a 25 pin
RS-232

You can use ANY standard Serial modem with the ST as long as your
terminal supports it.

No, not on sale yet. Mabey at the end of October-early November.
Steve Cohen would not take a pre-order from me, but he may be
promiseing dealers first dibs. $700.00 US for starters, and there
will be extras needed $$$$$.

STeve, you're looking in the wrong place. Look in the LATEST issues of
ST Applications. There twp back cover pages have the information you
need for ordering Gemulator 4 in the U.K. directly from a U.K. dealer.

For the current list of international dealers of Gemulator 4 you can
browse our dealer list at http://www.halcyon.com/brasoft/dealers.html
although note that we just added Compo and that hasn't been added to
the web page yet.

That may well be, but it's totally irrelevant as we're talking about
HARDdisks here. What you can do by the time 9 Gig on-board RAM is affordable
is not the point. You could also have brought up that a CD-ROM player can
be assigned to UI's greater than P:, which is completely correct.

All this does not change the fact that there is no way I can recognize all my
partitions (at one time) on my Falc. I always have to reboot and unmount
other drives for that. Now who can fix that ?
I have 8 (IDE 420 MB) + 4 (SCSI 850 MB) + 2 (Syquest) + 2 (ZIP) partitions.

No, the AHDI partition table (not really a table, it's more like
a chained list) does not limit the number of partitions per hard
disk, which is only limited by the number of sectors on the disk.

Maybe you were thinking of the Atari/NetBSD partition table, which
is limited to 16 partitions per harddisk.

> To access above drive 'P', you need a TOS version above 1.0.

See one of Uwe Seimet's articles in this thread, which mentions
the difference between BIOS devices and GEMDOS devices. You're
talking about GEMDOS devices here, while AHDI is only concerned
with BIOS devices.

413. Release of OASIS 1.35E

Newsgroup: comp.sys.atari.st
Date: 1995-10-10 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <813359920_OASIS_@yeadontt.demon.co.uk>
Source record: 157772

Tonight (Tuesday 10th of October) OASIS 1.35E has been uploaded to the Demon and Hensa FTP sites.

Here is a summary of the changes from version 1.34E to version 1.35E of OASIS

OASIS 1.35E

Bug fix for 'Indexing Lost Mail' (bug introduced at 1.34). It now works!

Bug fix for viewing Help on screens greater than 640 pixels wide. The text no longer 'escapes' from the right hand edge of the window.

LOW_MEM.PRG now functions correctly for people with 1Mb of memory.

From version 1.34 and onwards OASIS is now shareware. Anybody who wishes to can now pre-register OASIS for the fee of 10 UK pounds.

Pre-registered users will recieve a discount of 10 UK pounds when OASIS 2.0 is released.

The full package for OASIS 2.0 will include an updated OASIS including UUcoding built in, PGP support and more, ICE (the GEM replacement for NOS) and Spider (the graphic Web Browser).

The full registration fee for OASIS 2.0 will be 30 UK pounds, hence pre-registered users will only have to pay 20 UK pounds.

Everyone who pre-registers will recieve confirmation by E-Mail, in addition pre-registered users will recieve regular updates on progress with OASIS 2.0.

Send all cheques/international money orders (made payable to Mr P. Yeadon) to:-

Mr P. Yeadon,
29 Bolton Street,
Reddish,
Stockport,
Cheshire,
SK5 6BE,
England

Please include your Name, Snail Mail address and E-Mail address.

Anyone living in Sweden can pre-register OASIS with Dag Doa at:-

Dag Dao
Angelholmsgatan 12

S-21Y 22
Malme
Sweden

or via e-mail at:- dada@dada.pp.se

Hi!

ASH in Germany presented a brandnew spreadsheet and publisghing program
called TEXEL.

TEXEL is (or should once become) a MS Excel clone, a full spreadsheet
which takes advantage of all GEM features (vectorfonts, volour,
Iconify...), provides page preview and zomming on the spreadsheet, allows
to import MS Excel Files, has toolbars and supports the math coprocessor.

The package is priced at DM 149, currently only available in German (but
YOU might change that), requires 1Mb of meomory and is fully supported.

A demo version is available on ftp.uni-kl.de, look for the selfextracting
file texldemo.tos; Online help via ST guide and Bubbe help available.
Works on all Ataris (1 Mb minimum) and Atari comatabile OS (Magic Mac,
Gemulator, Janus etc..)

Regards,

Alfred

417. Oasis & MagiC - working

Newsgroup: comp.sys.atari.st
Date: 1995-10-10 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <813321502_OASIS_@swampdog.demon.co.uk>
Source record: 157776

This works for Oasis133 under MagiC 3. It may work for different combinations of the two but then again it may not.

Disable MagiC and run the Oasis installation program. Do not select the MagiC option. You may also find that if you ask for the transfer options then the installation can crash - so backups are in order.

Reboot MagiC.

You can now run Oasis as a multitasking process. It works fine except for the "Log On" option - it will not execute NOS - no matter, it does not need to.

You can execute NOS.TTP and Magic will run it in a VT52 window. I don't recommend this because keyboard input is *very* slow. You would have to mess around with the MagiC settings to get something usable.

In the OASIS folder rename NOS.TTP to NOS.PRG and make it into a single tasking process without running in a window.

When you want to log on, just execute NOS directly and do your stuff as normal. When NOS terminates switch to Oasis if it is running or execute it if it is not - select "Log On" then click on unbatch. Oasis does its thing then you can get on as normal.

Remember that MagiC (3 at least) does not need any serial code patch programs. I suppose also that the extra partitions available under MagiC will be usable in NOS as well.

You will have no problems using STiK and CAB! (Actually there are a few minor bugs.) Just make sure you read the instalation instructions carefully, and follow each of the steps. They are available in a file called WWW1xx.ZIP which you should be able to find on any major ftp site (HENSA, Atari Archive, uni-kl, or CNAM.) STiK does the low level comms stuff, but CAB is the actual WWW interface thing. (I hope this isn't too technical for anyone... >:)) It should work on any ST/STe/TT/Falcon, and currently only with a SLIP account. It's freeware, but I highly recomend sending in a donation. It took us long enough to actually get one, lets try to encourage it's continued development!

Our Gemulator 4 product emulates an ST and STE on a Windows machine, and
does allow you to play some games. However, there is one major
restriction and that is that the game disks cannot be copy protected.
If there is any sort of protection on the disk, the emulator will
probably not run it. Games that you can coy to the hard disk will
usually run. So it depends what you're trying to run.
You can browse our web page to find out more.

scooterb@xmission.com (Scooter Black) said:-

>The subject says it all. I tried to connect to it, but it wants a user
>name and a password. What am I supposed to put?

at login: (ie the first prompt)
ftp <cr>

password: (ie the second prompt)
username@ <cr>

for me this would be:
login: ftp <cr>
password: swampdog@ <cr>

and for you:
login: ftp <cr>
password: scooterb@ <cr>

This is the same for most sites. Sometimes 'ftp' won't work, use 'anonymous'
instead. The password can usually be any old garbage but it is polite to
give your username as this allows the site to tailor itself to user's needs.
Some sites insist that the username is entered for security reasons.

For speed you should assign your username to a function key. In NOS this would
be something like:

fkey <number> "scooterb@\r"

For completeness, the '@' effectively means "add the hostname" so when you
enter scooterb@ what actually gets sent is scooterb@xmission.com. The '@'
just saves typing.

>
> TIA!
>
> SoupIsGood Food
>

I think the favorite term proggy (shareware) is teddyterm (I know it sounds
silly, but it is pretty good). My favorite is Vanterm, cause its dead simple.

other Pd and Shareware that is good:

Award Maker Plus
Munch (art Proggy)
GemBench 4.03
OCR 1.3C
ST Guide Creator 4
Profile
Freedom
Idealist 3.6
Kivi
Let 'em fly
Master Browser
Everest V3.5E
Gemview V3.15
Speed of Light V3.8
POV2
Crack Art
Marcel
Photochrome 4
Octalyser

Games

Hoog
GNU Chess 3.5
Stelb 2.1
Astrodia
World of Henry
Square Off

Starball
Skyduel
Llamatron
Dynabusters+

All the above are sort of pretty good, If you need something then get one of the above, but you won't need it all, some stuff (eg. OCR) is specific for peoples needs. Nb. I cannot say where or if you'll find ALL the above stuff, but it'll be there somewhere !!!

Good luck

Last year when I tried it it looked 'okay' but as for GEM compliance
it won the booby prize. Even Freeze Dried was more GEM compliant.

I could not actually get it to do anything useful due to this.

I assume it has been through a radical update...

Subject: Re: Help request for ST Newbie

In my response to "Help request for ST Newbie", here's what several
ppl wrote and how I'll answer for them.

John S. Gray wrote (in a private e-mail letter):

>My 2 cents worth: Yes, the Marpet board is fine for RAM upgrades. BTW do
>you have the hardcopy version of the TOAD COMPUTERS catalog. from
>Severna Park MD? Generally if it's a buggy product, Toad won;t sell it,

>used
>SF314, which is double-sided to begin with, for less money. Also you
>might luck into one of the more recent 1040 STe (TOS 1.6 or 1.62) units:
>As more and more ST people leave the platform either to Falcon, Mac or
>DOS box. the price of these is plummeting. I bought a `spare' 1040 STe
>recently for $75.00 Canadian. If you go up to 2 or 4mB and a double
>sided
>drive, buy a copy of CALAMUS 1.09N, the page layout program. Then you'll
>be producing some great looking pages. However one really needs an
inkjet
>or laser printer to get instant results.

Toad sells the XTRA-RAM Deluxe board which Marpet makes; they just didn't
mention it in the catalog. You right about the drives tho, it's
easier to buy a replacement than just replacing the drive in the
casing which I thought Mike wanted to do. Now you need to at least
get DD drives since everybody else uses these and you can use them on
a PC(If formated at 80-9 of course). An STe is good if you want to
run a few STe programs or at least hook it up to your stereo for
better sound. (I'm interested in a cheap STe for spare parts BTW.)
Calamus, I don't know much about that; but it is a heck of an expensive
setup just to use it.

And Steve Taylor has filled in a few blanks I had made:

>>First, you have to save your documents as straight ASCII text. You
>>lose your bold, italics, and underlining however.
>
>Or alternatively, there is at least 2 utilities (i forget the names

>now) which will convert between 1st Word Plus, RTF, and other formats.
>This will retain formatting information and text highlights.

I'm so sorry I forgot about this, you can use The Ultimate
Converter(TUC) to convert from 1st Word to the PC WP and back. It's
a TTP program you you have to figure out how to use the commands in
the scripts. Great ultility!

>>use 1.44M but you can only use 720K. You need TOS 2.06 and AJAX chip
>>to use the HD format but it's hard to do especially on a 520STFM.
>
>You do not need TOS 2.06. You just need any utility which will format
>in high density - and there are loads around.
>And as for the Ajax chip, there are many users around who are managing
>quite well with the WD1772-02-02. Unfortunately my 02-02 is
>underspecified :-(

You can use a WD chip but it's a gamble. If you don't have a 20-20
chip, you will have to get it replaced. It may be easier IMHO to
just get a dealer put in a kit. But since I'm getting a new
computer anyway, I'm not to worry about this :)

Thanx for correcting any mistakes I made which I haven't yet read up on. :)

429. MIDI project for class

Newsgroup: comp.sys.atari.st
Date: 1995-10-10 00:00:00 UTC
From: Eric Noss <enoss@planetx.bloomu.edu>
Message-ID: <Pine.SUN.3.91.951010155358.8027B-100000@planetx.bloomu.edu>
Source record: 157788

I need to do a presentation on using the MIDI format for my class. I have an article on the history of MIDI and I will look in the library for more...but I may need some of the following:

- Structure of the MIDI file.

- Specs of MIDI ports.

- How ST's have been used MIDI for networking.

- How a Sound Blaster may play a MIDI file.

If anyone can also point out where on Gopher(and etc.) I can find more MIDI articles, that will be real helpful. I figured that MIDI is a popular subject with ST users. Thanx.

I believe Current Notes will be returning but with new staff. Eric March(Diehl) is currently writting some articles for it. I don't have his e-mail address but you can ask him on the way of his web page(which is like a desktop interface). http://www.io.org/~diehl/d-main0.html

You know, I did read that Joe said he's giving editorship to Howard Carson but everybody acted like it was the "last absolute" issue ever. I did enjoy articles from Dave Troy and David Small as well as the guy who wrote "Goodbye Atari". What I got out of it was that even if you do get a Pentium or a Power PC, you can still be an Atari user no matter what.

FOR SALE

Atari TT030 system includes:

Hardware:
1 working Atari TT030 with 6 megs of ram (2 ST, 4 TT)
-1.44 floppy
-TOS is copywrited 1991 (works with the internal 1.44 drive)
-revision H motherboard
-Mighty Mic 32B Ram expansion board (up to 22 megs)
-keyboard, Nashua mouse with software.
-manuels box and system disks

1 non-working "parts" TT030
-includes case and all chips (030, 68882)
-TOS (4 chips)
-2 megs of ram on board (socketed)
-extra "new" keyboard
-extra "new" atari mouse

1 External Floppy drive
-slim, for use with Spectre GCR

2 Extra joysticks

Spectre GCR with 128k Mac roms (allows the use of Mac formatted disks)

Software Includes: (in no particular order) (I have boxes/documentation for these)
-Steinberg Cubase 3.01 for the Atari ST/TT (original price 579.95) (has key)
-DynaCADD (has key)
-Publishing Partner Professional
-Easy Draw w/Personal Draw Art 1

I hope to many do not stray away just yet. I use the Macs at work
and the software is getting more of the PC flavor, and the poor
040 runs so hard just to fill the screen (except for Magic,it is
fast but you are on your own for help in the U.S.). I know the
Power PC is fast, but to utilize this, you must have all softs
optomized for the PPC. This is a great cost and 040 softs only run
as they would on an 33mhz 040. I do not have this much time in my
life and will remain married to my TOS machines. I will buy all the
new softs I can,of which there are still many, and give my Falcon a
boob job with one of the new accelerators that are available:).
Mabey someday I will be able to buy the Eagle with a DSP card
in the States, and again I will be happy. If anyone chooses to
change computer types, that is there right. I won't feel sorry
for them when Microsoft gives them a bite:). Besides, what
other brand can you find names like Wizztronics, Barracuda, Hard
& Soft, Titan Design, Compubuild, TT, Falcon (cool,right), Stacy,
SpeedResouliton, FX-Card, Ram Gizzmo, Cubase Audio, FDI, MegaSTE

C-Lab Falcon, GE-Soft,and the list goes on and on.

Just the rambling's of a hopelessly insane addicted TOS user :)

AFAIK the newest HUSHI 6.10 can work with SCSI III drives. It also has
special configuration options for Quantum drives.

regards,

Simon.

Source record: 157705

I have an Atari-1040 ste with 1 meg memory with color monitor
and 3 disk drives (1 internal) (2 external) double sided. All in great
working condition. I also have lots of games about 300 or more
and some modem programs, word processors etc. Good commercial
games such as Dungeon Master I and II, kings quest 2 & 3 and 4,
and many many others. I will sell for $425 firm and include shipping.
If a check is written It must clear bank before I ship. If interested
leave me some E-Mail and I can give you my home phone if you want
to know more.

From: az822@FreeNet.Carleton.CA
Message-ID: <DGALyp.JtL@freenet.carleton.ca>
Source record: 157707

I've been looking for a copy of magicmac that will run on my 7100/66 power mac. I posted a question last week about compatibility. Toad Computers said it was for 030 and 040 based machines only! Judging from the responses here, that is not true! So my next question is???
Is there an English language version available that will work on my power mac?
Or...
Does one really need the English language version to use magicmac effectively?

Thanks again!

Angus Armstrong

445. Re: STiK/CAB - where should home page be?

Newsgroup: comp.sys.atari.st
Date: 1995-10-11 00:00:00 UTC
From: dsb@cs.duke.edu
Message-ID: <45gjt2$485@duke.cs.duke.edu>
Source record: 157710

From the Holy Book of <813086670snz@lobotomy.demon.co.uk>
as spake by marc@lobotomy.demon.co.uk :
>I have been running STiK/CAB for a couple of days now and I'm baffled by the
>"Home Page" menu entry. What is it supposed to do? I presume it's to take me
>to my home page; if so, then how do I tell CAB what my home page is? Enquiring
>minds (this one, at least) would like to know!

Assuming CAB supports it, you can use a file:// URL to refer to a file
on your hard drive. So for instance:

file://localhost/c|/keepgoin.g/deeper/wait4it/hereitis.htm

(IIRC) would correspond to the file c:\keepgoin.g\deeper\wait4it\hereitis.htm
--- notice that : is replaced by | and \ by / in the URL.

Of course, no one but you would be able to access your home page via
this URL. To make it public, you'd have to put it on your service
provider's web server (if they allow that), in which case they can tell
you what URL to use.

I just got a brand new 90mhz pentium with 32 mb RAM and all the bells and whistles. Did I sell my Falcon? Nope: it has itï¿½s most secure place in music production, some image processing and many other things. Although the raw speed of a P90 is awesome, it does not give the audio capabilities, and itï¿½s useless unless you have exactly the programs you need, for it (luckily I have them from PC also :-)).
Get a life, and get all those wonderful machines, and praise all the OSï¿½s. What do you have to loose? And donï¿½t get it personal - itï¿½s machines what weï¿½re talking about.

Message-ID: <FJLUCBAIUP@goosie_u.on-luebeck.de>
Source record: 157721

Hello,

I have just got STiK and have installed it right after.
But now I am in trouble. STiK seems to work fine. It gets the connection
and the IP address correct. But when I execute the IRC client it does not
work and nor does the HTML browser.

The HTML browser says "Read error on bla....." on every page I want to
access, even on the homepage of the provider.
IRC tells me that the HOSTNAME is not set, but in DEFAULT.CFG the hostname
is set by "HOSTNAME = on-luebeck.de".

So, why does this happen and how can I correct it ?

BTW: Where can I set the netmask and how can I change between CSLIP and
SLIP ??

Ok, so long

Heya guys... I've got a Mega2 ST as part of my MIDI setup, and lots of people on here have been great to help me getting back into this ST thing... Another question for all of you... ive got a MIDI expander (the Steinburg Midex) that plugs into my cart port and makes the coiled cable there hard to plug in, and bends it. Does anyone know a way I can get a straight cable, or what kind of cable this is? something longer would be nice, i don't mind paying for it as this is a huge pain in the butt.

thanks!

matt

As I said, I got the release & version numbers from the cookie which MagiC installs. The disk label says 2.0 but the software says different. Perhaps the MagiC authors call version 3, V2.0 - it would seem a bit odd though.

Also, unless people are keeping quiet on this, I appear to be the only one who is not having *major* problems with Oasis & MagiC. Maybe I just got lucky and did the right things, I don't know.

I'd like to email you the program I wrote to test the MagiC cookie, so you can try it on your version - I'm interested in the results. Email me if you want me to send it.

gmiller@inca.co.nz (Gaven Miller) writes:

>TOS 1.2 extended this, to allow you access to all drive letters up to 'Z',
>so that adds another ten partitions (2560Mbytes = 2.5Gb), to give a total
>of 6Gbytes.

There is a lot of wrong information about TOS limits, indeed. No version of
TOS supports more than 14 partitions. More than 14 partitions are only
possible with MagiC 3 and with a hard disk driver that is MagiC 3 aware.

>Unfortunately, GEMDOS hard drives only have room for four partitions in
>the bootsector of the hard drive. Making one into an extended partition,
>and encompassing many smaller partitions into it, one could in theory go
>to a lot more than the one gig that this would otherwise limit you to
>(four times 256 = 1024Mbytes = 1 Gbyte).

GEMDOS hard drives? What's this? Hard disk partitions are never GEMDOS
drives, always BIOS drives. Since AHDI 3.00 (1989) it's possible to have as
many partitions on your drive as you want. You may have 100 partitions or so
but TOS will only be able to use 14 of them, with MagiC you can use 23 of
them. Assuming you have TOS 1.04 or higher (older versions are very slow
concerning big partitions and shouldn't be used any more) you can get 14*512
MByte = 7 GByte capacity. With TOS 4.0 you can have 14*1GByte = 14 GByte.
WIth MagiC 3 you can access up to 23*1GByte = 23 GByte.
This all is reality and not just theory.

>> Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS
>> version if I remember rightly, and BGM, AFAIK, can always be anything up
>> to 512MB. There is no way to go over 512MB, except perhaps an alternative
>> filesystem.

Wrong, see above. WIth TOS 4.0 and MagiC 3 1 GByte is possible.

>According to the Compendium, "A hard disk may have up to four standard
>(GEM or BGM) partitions or three standard and one extended (XGM)
>partition. The first partition of a hard disk must be a standard one".
>(pg 4.16)

So the compendium is wrong. THere may be an arbitray number of XGM
partitions, Each XGM partition may have aonther XGM partition and so on.

I've just visited to Be's Web pages, and all this seems to be a pretty cool venture. They're fighting an uphill battle, but if they can deliver what they promise, the BeBox might be a cool platform to develop for. They have incorporated many of the best features from various platforms (including Atari - they have Midi ports as a standard equipment), and they seem to know what they are doing. Note that they are *not* offering complete boxes, just the main unit without RAM, hard disks and graphics card, and you need a Macintosh for development right now.

From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DGABvn.BEq@cf.ac.uk>
Source record: 157797

Yeah, no way I'm going to win-hell with intel, I'm totally dedicated to my TT, though I would consider a power mac if one dropped on my doorstep! (but would order mac magic straight away!)

It's only when I sit here at work, using this pentium day in, day out, with its 32MB RAM, 133MHz processor, 4MB video card, and a hard disk that still sounds like it's got indigestion that I wonder... Isn't it something when bookshops have over 2 dozen "PC" mags, full of the same crap, coverdisks (CD's) FULL of the same crap. Well, it's obvious we can't deny our ST's are more "powerful" than the new age of intel machines, but there again they are better designed, reliable, friendly and actually pretty nippy considering their specs. I think intel's biggest hurdle of the dreaded 640k dos mem will ALWAYS be present, and this is where the problems start and end.

OK one doesnt want to start another bitching session on pc's, they are part of life, so let's leave them to those who need them. Meanwhile think before abandoning your st,tt,ste,medusa or whatever.... Why? What do you want to do with your computer? Perhaps Atari's only major pitfall was (ST-TT) the pathetic colour resolutions available, well they almost fixed that in the falcon but otherwise unless you've a TT, medusa or Mega STe your out of luck.

Simply put, why shouldn't machines like the Medusa and Eagle be available at realistic competitive prices? Then maybe the world might change. Or perhaps Atari should change their names to something less associated with video games machines! I don't know, ...

Ok, that's my pennies worth, for what it's worth, back to work.....

472. Need: Cover disks from ST-FORMAT!

>other drives for that. Now who can fix that ?
>I have 8 (IDE 420 MB) + 4 (SCSI 850 MB) + 2 (Syquest) + 2 (ZIP) partitions.

That is true, 9Gbytes of RAM aint likely soon.

In my defence, the local time when I posted my reply was 5:10 AM. I was,
to put it mildly, a bit dopey after a 30+ hour worksession. My cogitative
powers were somewhat dulled as a result.

What I was meaning was to boot with hard drives with enough active
partitions to (say) N:. Then load a string of four RAM discs (10k each),
as drives O: P: Q: R:.

If you are not able to access partitions/drives (in this case ramdiscs)
above P:, then it may be that your driver software may be at fault.

I was _NOT_ saying to use RAM discs totalling 9Gbytes. That was your
interpretation. (Although it may be said that my wording was a little
ambiguous, so your interpretation of my ambiguousity may be deemed
potentially correct).

Using a string of ramdiscs was just a test to see if drives above P: were
accessible.

Once you have determined that drives Q and R are accessible, then you can
start tracking down the driver software.

Disable the RAM discs. They have served their purpose.

Carry on trying to isolate what is causing devices to fail to be recognised.

>last week ??????

No. This looks like an entirely new, proprietary platform. I checked out
the net page, and it doesn't mention what OS it is using. It did say however,
that it was running with two PPCs in it, while the Microbox rumour specifically
said it contained a 68060 with the Tom & Jerry collaboration from the Jaguar.
There doesn't seem to be much of a chance that they would be the same thing,
because that is a huge difference in archtecture.
With regards to the Microbox rumour, that would be one deadly machine, if
it comes in for a reasonable price. (Assuming it appears at all...) If anyone
has any more information (complete with sources >:)) I would love to read
more about it! (Don't get me wrong, the BeBox looks interesting too...)

To be fair, I think the Compendium is just talking about the initial partition
sector. That can indeed only have one XGM link; the Compendium also says that
an XGM partition sector can contain a link to another XGM partition.

No, forget it. It is quite hard to write software to read HFS volumes. For
an experienced Mac programmer, it'll still take some weeks of development.
That's not worth it.

This content of the above message demonstrates very little intelligence.
Darek HAS BEEN at Microsoft for some time.

Darek HAS CONTINUED to run his Branch Always Software and has new
versions of 8-bit and ST emulators for PC.

Darek HAS BEEN at many Atari shows, even the last one in San Francisco
(can't remember the name).

Darek can not be blamed for working at Microsoft. Everyone has to make a
living. He's probably doing well for himself there. Good for him. I
find it in poor taste to say "he has $$ in his eyes" because he goes to
work and makes a living. There are too many people who do the opposite.
Bitch about them.

James

>Intel's shortcomings and the software and hardware get the job done.
>What's the problem?

Since you've gone to such trouble to cop an ATTITUDE with what was to be
considered a mostly humorous realization, I feel a response is in order.

First, I am NOT an amateur assembly language programmer. In fact, I make my
living writing software in assembly for the following microprocessors:
* 6502
* 68000
* Intel 8051 -- embedded systems programming
* Motorola 65HC11 -- embedded systems programming
and YES...
* 80x86

So I recommend you think carefully before making such ridiculous,
presumptuous assertions.

Second, the Intel chip designs have historically been illogical. The 80x86
series is the most propular of their chips, but the 8051 has just as many
ABSURD characteristics (i.e. separate code and data memory-- who though of
that one?) and it is primarily used as an embedded processor.

Consider these 80x86 specs:
* segmented memory -- I assume you don't program the Intel chips or
else your reply wouldn't have demonstrated such ignorance. The
memory of the 80x86 chips is segmented into 64K chunks. This means

that if you want to access data that is more than 64K away from
the instruction that the processor is current executing, you must
shift the SEGMENT:OFFSET registers to point to a different 64K memory
chunk. This is stupid. I'd venture to say it's the work of the
afore-mentioned Intel moron (presumably the same one who separated the
code and data memory of the 8051).

* backwards memory address (little-endian) -- Intel chips store an address
in the format LSB, MSB. This is akin to us writing the number 1234 as
3412. IT DOESN'T MAKE SENSE. Furthermore, it raises the question of
how numbers larger than 16bits should be stored. Do you store a 32bit
integer in the format LSW MSW so that the bytes are ordered as follows:

LSW (LSB MSB) MSW (LSB MSB)

or should it be stored this way:

MSW (LSB MSB) LSW (LSB MSB)

It doesn't matter because neither notation makes any sense.

* Real mode, protected mode, etc... need I say more? How many modes should
one chip have ?

Yes, Intel chips DO dominated the market. Intel can thank IBM for this. IBM
basically GAVE their system design away in the 80s. Now every Mom and Pop business
can make computers and not even need to spend a DIME designing one. This
is what gave Intel their momentum.

In fact, have you ever wondered why every NON-PC computer that has been released
does NOT use the Intel 80x86 series? Think about it. The ST, the Amiga, the NeXT,
Apple Macintosh, Atari Jaguar, Sega Genesis, Sega Saturn, the Nintendos,
the Sony Playstation, etc. ALL DO NOT USE INTEL CHIPS. By far the majority use
the Motorola 68K series for good reason. It is well-designed and a joy to program.

It is with GREAT ignorance that to ASSUME that market domination==GOOD DESIGN. One
DOES NOT imply the other.

Having said this, I believe I shall now climb back onto my high-horse and return
to the task at hand, which is programming my Intel-based PC -- which brings me
to the crux of what I am trying to convey: unlike you I KNOW what I'm talking
about.

I'm afraid the cnam archive is closed for some (very) long time;
not only the atari part of it, but all of the archives this site used to
maintain. I hope L. Rousseau, maintainer of the atari part, will tell us
more precisely what's happening.

Another site which seems to have problems is src.doc.ic.ac.uk: it used
to be one good Umich mirrors, but it hasn't been updated since Aug 31.

I tried nic.switch, but this one doesn't carry all the directories from
Umich, so can it be called a mirror ?

It looks like bad times are coming for the Atari.

From: cherridge@delphi.com
Message-ID: <BdNA3Vp.cherridge@delphi.com>
Source record: 157745

I finally did get the STIX program to accept my server and using the APP function, I did turn it on. But that's all. I even sset the CACHE file on the root directory and set the pathway and it seems to have files already in it.
.
The problem is, When I go to the Hot List, or try to manually load up a wed site, it tells me that there is an error in loading. So far, I haven't seen one image on the screen. I have a 1040 Ste, with 4 megs of ram and two floppy drives. There ought be a way....
.
I think I need a genius out there to help me.
.

: about it either -- (s)he is not responsible for your
: failure to notice the difference between C and Ada.

There are lots of different kinds of computer users
reading this message area.. We all may still remember
the "war" between DOS- and Macintosh-users. Those people
who preferred command line interfaces often couldn't
stand "toys" like mouses and graphical user interfaces.

As I see it, something from those times has stayed alive.
Some people just like computing to be 'computer-like' -
and others (like me) have no interest in learning how
to set up a Unix-like file system... I just want to get
things done, as easily as possible. From this point of
view, almost all MiNT-software is almost useless to me,
and people who think the same way.

But sometimes there are no alternatives - like in case
of DUftp. If I want to use ftp from my home - then I
have to step into a world I don't feel my own. I love
to work with Calamus, or make complex graphics. But it's
very different from creating "symbolic links", etc to
MinixFS !

: In other words, when you're going to install MiNTNet,
: you're assumed to have at least some basic knowledge
: about TCP/IP networking -- get a book about the topic,
: but don't expect the software author to provide
: (possibly illegal) copies of such books. Most certainly
: you shouldn't expect to gain that basic knowledge from
: the documentation for an FTP client.

If some programmers don't want "non-programming-oriented"
Atari-users (or whatever we want to call them) to use their

software for example because those people want to stay away
from MiNT... And there are no alternatives for e.g. ftp...
Should I - and people like me - turn into Mac-users?
Do you say I don't have the right to expect the programmers
to listen (and honor) people's different expectations?

No, I don't think you mean that at all. But the times of
old DOS are (and I think, should be..) over. Today's programs
have to be user-friendly, intuitive, and they shouldn't
expect the user to make any higher magic in order to get them
functioning IMHO...

I'd hate to see Atari-platform turn into a cryptic half-Unix,
half-TOS chaos. Well, some people might like that, no doubt.

Log on with NOS manually. After the login and password prompt there is the
protocol. After this my server (Demon) outputs:

IP Address: (whatever it is)

If your server does the same, change the search string so that it matches
the line containing the IP, otherwise I haven't a clue!

It's probably not possible to connect the SLM605 to the PC at a reasonable
cost. I had the same problem a while ago. I tried the following route:

- Export Postscript data on the PC
- Write the Postscript file to a disk (alternatively: transfer through a
network of some sort)
- Use a Postscript interpreter on the ST/TT to display/print the file;
I tried ghostview, and recently I found UltraScript which might be
able to do the same (my copy doesn't work on the TT, so I can't tell)

Since Ghostview does not use the original Adobe fonts, the results
were less than satisfying in my case, though.

You can fix that by using Magic 3 (*really* soon available for Falcon :-)
and a recent hard disk driver which supports that (HDDRIVER comes to mind).

Woe to the amateur assembly language programmers who become highly opinionated to the point that they call Intel, the most dominant chip makers in the industry, "morons." A "moron" is a mentally retarded person having a mental age from 7 - 12 years. That is a completely assinine claim. No, Intels are not perfect. However, there are many fine programmers who make ritzy livings programming for Intel machines. Perhaps it's too tough for you. That's ok - let the others rake in the fortune while you sit on you highly opinionated high horse and scoff at the opportunity. Somehow these "moron" programmers get around the Intel's shortcomings and the software and hardware get the job done. What's the problem?

>be present, and this is where the problems start and end.

Such old, old, old news. I know of everyone from scientific engineers to uneducated housewifes/househusbands who can't even use a scientific calculator - who all use PCs. What's the great difficulty? They sell these things at Wal-Mart, for crying out loud. Yes, the "640K" hurdle may exist, but thankfully, there are many programmers who do the work and make the software easy to use and many PC users don't even encounter the problem, while others do. So what? What is perfect? No platform is.

Is this kind of dribble what it means to be an Atari owner nowdays? Why can't Atari users (or others) just use their computer if it serves them, and quit trying to qualify OVER AND OVER why they use their Atari?

Is it because you are all highly emotional creatures and have some love affair with the Atari? (i.e. "totally dedicated to my TT")

I am dedicated to NO computer. The purpose of a computer (to me) is to serve me as does my television set, microwave oven, and automobile. I am not dedicated to these devices; they are "dedicated" to serve me. They are devices of utility and convenience. When any of those devices (computer included) fail to serve me adequately, they will be replaced.

Does "shooting down" at other platforms somehow (in the minds of these three) somehow personally help you to reinforce your decision to keep your Atari?

Does emotional opinion snuff out objective, logical reasoning? I'm not here to blow horns for ANY platform. I find it ridiculous that others resort to such childish behavior. I see the same behavior between Chevrolet and Ford owners of cars and trucks. I drive both. Both get the job done. Both serve me fine. Yet, one Chevy owner (highly opinionated) will claim that "FORD SUCKS" and another Ford owner will claim that "CHEVY SUCKS."

I believe they may feel this way because of one or more of the following reasons:

1) They have found ONE little circumstance (perhaps even long ago) that they used to form a high opinion for/against Chevy or Ford, an opinion which may ignore present conditions, and may have been formed through their own faulty observation. They take the specific instance of one problem of one model at one time and erroneously generalize it to mean that "the other brand sucks," as a single-issue voter does in an election. Their mind was made up (closed) long ago and therefore reason plays no part in formulation of the ignorant opinion which they hold so highly and beleive in so strongly.

2) They are a "know-it-all." They happen to own one brand rather than the other. Amongst a group people of lesser intelligence, THEY believe what THEY have to be the best. They give no consideration to the fact that other circumstances gave rise to what brand they now own. They can't see the possibility that circumstances might have changed; they ignorantly foster an egocentric opinion that THEY have the best. In accordance with THEM having the best, they reinforce their belief with a contention that "the other brand SUCKS." Insecurity plays a large role in this. It is comforting for an insecure person to believe that he/she has the best, and has therefore made all the right decisions in life.

3) In many cases, I'm sure it's a combination. A person beleives what he/she has to be the best for (above) reason #2, for example, and then

will dig (using above #1) to find ONE example to reinforce the belief.

Who knows what else? I'm no psychologist, but I don't need to be to sensibly see what's going on. I suppose that many (not every) Chevy owner thinks the guy who bought a Ford is a complete MORON and IDIOT, and there are some Ford owners who feel the same way about Chevys. There certainly ARE some Atari owners who must *really think* that all those people buying ALL THOSE OTHER COMPUTERS THAT ARE INDEED SELLING, are stupid or are making the wrong decision. Sorry bucko - they buy what they get cheap and easy and gets the job done. You may think that my brand of car or computer "SUCKS" and in your little mind beleive that I am a fool for owning it, but your egocentric, erroneous perspective doens't change the reality that what I have DOES serve me well, as it does lots of other people.

The market doesn't always make the most intelligent decisions. However, no product that "SUCKS" is going to walk away with a large share (or a vast majority) of that market. This is certainly **NOT** to say that what wins in the market is perfect; it may not even be the ideal model. It does NOT, however, "SUCK."

I'm sure there are some drivers of Yugo automobiles (I owned a '86 Yugo once as a _very_ cheap novelty 2nd car which I sold at a profit) who refuse to upgrade, and look at all the drivers of other brands of cars and dream up ways to qualify their belief that they own the superior product. It should be brought to their attention that those cars are out of production; Yugo failed in the marketplace.

There are some drivers of VW Beetles that refuse to buy anything else, refusing to upgrade. They scoff at cars that require water for cooling; their's doesn't. Sure, at one time, the Beetle was a great, competitive little car. However, circumstances changed and other models offered more than the Beetle could. Beetle sales steadily declined as it begin to fail in the marketplace. The market changed. The market advanced. Other designs offered additional features and were even cheaper designs. I'm sure there are some owners there who became so emotionally attached to their Beetles that they couldn't see nor smell the changes in the marketplace. Sounds like the attitudes of some Atari owners, if you ask me. They must still be living in 1985.

****
>WIth MagiC 3 you can access
> up to 23*1GByte = 23 GByte. This all is reality and not just theory.

I have TOS 4.04, and HDDriver 3.51.. but it will NOT let me use a partition above about 512Meg.. I can create it, but when I try to access it from the desktop by double clicking, it won't open a window on it, and it does not appear as a drive available to AudioTracker.

It's really hacking me off, because I have a 1.2Gb drive, acquired specifically to give me a large partition for d2d. from what you say, I should be able to set up a 1Gb partition.. if so, do I need any special setup in HDDriver? The drive worksa fine partitioned to <512Mb/partition.

Mark

Falcon, TOS 4.04, HDDriver 3.51, DEC RZ57 (1.2Gb), internal ide @340, DEC RZ56 (640Mb), and some other 540Mb scsi.

: > bank in the 1040 is populated.

: Look carefully and you'll see that there are three (or is it only two?)
: resistors next to each other that have to be inserted as well.
: Otherwise it should work - if you don't manage to mess up the motherboard.

.......CAUTION...This upgrade you describe is not a straight thru
operation. The lesser ram installation is generally done with rubbon
soldering, where all of the soldering is done at one dip, rather than
doing each separately. For this reason the parts of the board that are
not populated need to have ALL the solder removed from their connections
before the user tries to do anything. You should have be careful with
this. You will also need resistors as indicated above.

DOUBLE GOOD LUCK

Here goes my bit:

A couple of people mentioned that the 640K limit was vanishing - rubbish. You may be right when talking about the stuff microsoft and other huge companies turn out, but just look at the hundreds of thousands of shareware and PD programs about - hardly ANY are written to cope with the 640K limit.

I would expect a computer like a PC to really outstrip current ataris, but that just doesn't happen. Its great to compare a program like calamus with say microsoft publisher - when you import a piccy, then mp just goes to sleep for 15 mins, with bad indegestion (the HDD). And I hear you cry - but its faster with W95, yeh if you have 8Megs Ram and a half Gig HDD. so how come Calamus can handle it with 4 or less megs and no HDD (no swap files so no HDD needed.)

Just wake up to the fact that you are being ripped off when you buy a PC. PC programers on the whole, have problems with writing, small, tight, well formed, FAST PC code (with the exception of those who programed DOOM.). A pentium PC should be so much faster that my 5 year old ST, but heck its just not that much faster.

You want to use a PC, then go ahead, just don't be proud of it. The only reason the masses embrace it is 'cause the masses jsut haven't seen anything else.

Thats it, flame away.

>The moral of this story... if you have Oasis up and running then try this
>and you'll have an all in one (sort of!) package.

1. Oasis contains no TCP/IP code.
2. When you exit NOS, you are disconnected from the Internet.
3. In any case, NOS does not allow external programs to use its sockets.
4. CAB only works with STIK.

I think you'll find you are actually using STIK. Try renaming stik.acc to
stik.acx and rebooting, then see if it all still works..

>Hope this info helps someone.

I doubt it.

: Anywhere theres my bit - personally I think PeeCees are ok (I use one on
: occasions) however I think they are REALLY over rated, and people not even
: knowing there are other computers out there doesn't help. Still I prefer
: my good ol' Atari any day !!!

I'd agree, PC's are over rated simply because the niave markte believes they
are just about the computer on the market.

Sure the Falcon (or ST) lacks some of the glossy features, but overall
everything people are likely to need is already built in under that
elegant *exterior*.

Overall the Atari does what I ask it and combined even with budget printers,
modems etc, can quite easily compete with the PC' of this world.

Bradly Maurer (gregor@shelly.goldengate.net) wrote:
: the configuration etc to much extent. Is it really worth the time?

In my opinion it is. If you have SLIP access to the Internet, install STiK.

: Does it work for the most part (the most we atarians can expect!) and

STiK is actually alot easier to set up and a lot more solid than a lot of
stuff I have dealt with on other platforms.

: sketchy when it comes to which video mode is best...should I run in mono
: or color for the best results as to the graphics (I have both mons).

STiK doesn't display much as it is just the connectivity portion of the
package you downloaded. CAB (also called HTML in some releases) is the
Web Browser that displays things. It'll run in any resolution, but I
recommend mono myself. Maybe in the future CAB can have an option to
scale the graphics by half or to the quarter to make running in the lower
resolutions better. Then ST-Low would actually be pretty cool (just use
the Systems tiny font).

You can get DCSTICK which lets you use a joystick fo ra mouse, but you
still should use a mouse. If your 1040STFM came with a mouse, us ethat
instead. Besides you get more memory and a better TOS.

> Also: are there any substitutes for the power supply (can I use

You can get a new power supply from Toad Computers. It's just not a good
idea to use one from any other computer. (If someone did this saftey
however, please let me know).

You need some software to get anywhere with your comptuer. I built my
collection off of coverdisks, BBS's, PD disks, and some games I bought.
See more on this below.

> The hard drive was spinning and humming,

You need to get the ICD drivers.

> The drive also seems to have no way to set the device
> number(haven't cracked the case yet, but that control should be on the

> internal one?

Only if it is last on the daisy chain of hard drives. But I need more
information on MegaArchives, any takers?

MagicMac does work well on any 68K based Mac, the latest version 1.2.2
should be able to run on a PowerMac.

Try ftp.toad.net/pub/umich, that's a huge collection of ST software to
get you started. You can also try the Hensa Archives.

> No I am intrigued...I have heard a little about these machines,

An FAQ for first-time ST users, that's not a bad idea. Maybe I'll get
the ball rolling on that.

Actually I'm getting an AMD which are more effiectent and cheaper than
the Intel chips. Their 486DX4 is the same speed as a Intel P60.

You are right about the Intel compared to the Motorola. The 68K is
superior in most ways. I'm taking an assembler class for the x86 and
even my teacher says the same thing. I would rather learn how to develop
for a 68K machine mainly the ST.

See, because of Atari's "pride" in supporting their computers it makes no
sense for me to buy a Falcon or even a Mega STe if I end uo having to
spend money getting as PC anyway. And with Sam T leading Atari down the
flusher on a white horse, is it any wonder that many ST owners are having
to buy machines with CPU's designed by morons :P I have to consider a PC
because Atari will not support their ST's(in terms of service) so it's a
shame that I choose PC games over the Jag for the same stinking reason!

As I said before, I would like to see the Atari platform contiune even if
it's on a "mainstream" platform. If I can run Windoze programs on Linux
and find a copy of DR DOS for the DOS programs, I would have no need of
Winblows 95. That would be my way of giving Gate$ a cocky
four-finger-with-thumb-on nose salute :)

Whaaaaaaaahhh...
My sm1224 just died 3 nights ago.
It's a Goldstar variety built in 1989, served solidly and reliably
until 12 months ago until it developed a 'shimmering' image. It was
still usable though, but I suspect the frequent thumps didn't actually
do that much good. Anybody got a circuit diagram?

I have a SH 204 ATARI HD with a dead drive mechanism. The rest is in good shape. What type of drive mechanism can I replace it with? Will any scsi drive work? Does it have to be mfm or rll? Does it matter? I would like to get a larger drive in the box if possible. Any help would be appreciated. My knowledge is limited on this subject. Thanks for your help!

Message-ID: <813603260snz@f030.demon.co.uk>
Source record: 157653

Hi!

I need an art package that *MUST* do all the following:

Load .IMG monochrome and colour files
Save *small* blocks in .GIF 256-colour format
Be able to make backgrounds of .GIF files transparent
Fit in my system specs - Falcon030, 4MB, 130MB HD, T4.04, 256 colour VGA

Why? Mainly because I'm experimenting with Web page construction
and want to include my own hand-scanned and hand-drawn graphics.

If you know of a suitable package that encompasses all of the above
points, please let me know what it is and where I can find it.

Thanks,

Andy

Hello all

Could somebody recommend a program that is capable of producing nice looking output of fractions?

Nothing to complicated just something like p/ab but above each other not on the same line. The ability to make the components to the power of whatever would be a plus.

Cheers.

p.s. Please don't recommend TeX, I haven't got the time to set it up.

Sorry no-can-do:

ZIP uses the pasword as a key to encrypt the data. ZIP
does not store the password in any form in the .zip file.

You can't remember the password.

Ergo: You can't uncrypt the data.

Simple, but sad.

I did not claim that YOU were an amatuer programmer. I said that there
are many amatuer programmers who jump on the "Intel sucks" bandwagon.

> Second, the Intel chip designs have historically been illogical. The 80x86

Yes, we've all heard this before. I never claimed they were perfect;
they do the job quickly and cheaply in a properly-designed system.

>
> Consider these 80x86 specs:
> * segmented memory -- I assume you don't program the Intel chips or
> else your reply wouldn't have demonstrated such ignorance.

My reply demonstrated no ignorance. It would appear YOU are the ignorant
one when it comes to reading comprehension. Did I say that Intel chips
were a theoretically ideal design? Did I say they were perfect? Did I?
No you ignoramous. I merely stated, ONCE AGAIN, that they don't "suck"
because nothing "sucks" that actually DOES get the job done at an
incredible price/performace (value) ratio. Do you care to dispute that?

For your information, I am a very unpracticed, unskilled programmer. I
have only programmed in 6502 a little, a long time ago, on my 8-bit
Atari. I looked at some books for 8086 and discovered all of the
difficulties you ramble about. I was put off, and never tried it. I am
not a programmer, however, and do not attest to be, nor do I make my
living doing so. However, dispite all the PISSING and MOANING and
BITCHING about how the Intel chips are "illogical" and "lame" and "suck",
my contention is that it is good that the Intel platform benefits from
many programmers (unlike me, who is not a programmer) who know how to put
the hardware to work.

The difference between our viewpoints is that I am simply stating my
observations - like watching Peter Norton's neat programs work after I
open the Box - and you are attesting to be an expert. The difference
between you and Peter Norton is that he knows how to program an
"imperfect" Intel design to the point that I, the end user, don't really
need to deal with SEGMENT:OFFSET registers - and YOU simply bitch about them.

> In fact, have you ever wondered why every NON-PC computer that has been released
> does NOT use the Intel 80x86 series? Think about it.

Uhhh....only a dumbass would design a proprietary computer with Intel chips when they can cheapily copy the IBM architecture and enter a homologous market of PC compatibles. Good thing you're not the Marketing Director at Compaq or they probably wouldn't be around this day.

Actually, I never gave thought to the "morinic" idea of a proprietary Intel design - until you brought it up....I'm laughing now.

> It is with GREAT ignorance that to ASSUME that market domination==GOOD DESIGN. One
> DOES NOT imply the other.

Seeing that no product is perfect, it is logical do deduce that all products are flawed to a varying degree. Thus the PC is indeed a flawed product. However, the INCREDIBLE market domination would never have been attained if the product SUCKED as bad as simpletons like you contend. How could it? Is the computer buying populace SO MUCH DUMBER than you? I think not. The computer buying populace has grabbed on to the most computing VALUE and POWER ever to grace a desktop. So it's not perfect. So what? This doesn't invalidate the usefulness of the product as you would like to believe.

Why must you place VALUE JUDGEMENTS in the arguement, such as "GOOD DESIGN?" I made none. I simply state facts. I said (for the ump-teenth time now) that they GET THE JOB DONE WELL FOR THE END USER. Why should I give a rat's ass whether or not a value judgement of "good" be placed on the processor when it does its job admirably in the hands of a good programmer? I'm sure the best PC programmers in the world would agree about the shorcomings of the platform; however, they do some pretty kick-ass things in software on the PC (Atari emulation, for example) so while I concur that they are difficult to program, I maintain that they sure work well when they are programmed properly, and they cost very little, and the value is the best ever in the industry. If you can muster the cognitive power and word comprehension to accomplish anything, I beg you to dispute (using fact, not value judgements) the sentence previous to this one.

> Having said this, I believe I shall now climb back onto my high-horse and return
> to the task at hand, which is programming my Intel-based PC -- which brings me
> to the crux of what I am trying to convey: unlike you I KNOW what I'm talking
> about.

I suppose that last sentence is the punch line in another attempt to be humorous? I seriously doubt I'll see the name "Michael Ellis" on any of my software packages or even on my computer screen, except for the times that I enter this newsgroup.

James

I don't give a rats ass about crappy software made when much
better ST versions were available or at the dawn of time. I'm
no stinkin IS cobol guru. 10 year old software is irrelevant.
|newer Atari - like a TT or Falcon. Hell, some won't even work with newer
|versions of TOS. No product is perfect, is it?
I had very few programs that broke under rainbow tos and that's
the one that broke most of them.

And yes I'll piss and moan about it. It's a valid gripe and one
that can't be so easily glossed over. It's truely pathetic to not
be able to use the rest of your 16Megs because of a design decision
in the OS to limit an enviroment space to a fixed amount of main
memory the size of an Atari 800+ (64K).
|
|
|| What makes you think it's merely insecure atarians. One doesn't
|| need a Fuji to see truely backwards nature of msdos clones.
|
|
|I see the "backward nature" when I run an *old* statistics or physics
|program (or even a CGA game) on my cheap-ass 486 and the thing actually
|runs. There's a flip-side to the coin. Once again, no product is perfect.
Yeah, run a version of Double Dragon that makes the ST look like
a bloody Amiga. I bought the ST then because I didn't want to be
subjected to such junk.

The much hyped IBM software library is greatly overhyped.
|
|
|| |
|| No we got spoiled by not being constrained by the dominant OS
|| for our machine NOT straightjacketing us or preventing us
|| from realizing the full potential of our hardware.
|
|You got straightjacketed into buying MEGS of ST RAM and MEGS of TT RAM -
|a serious duplication of hardware. You got straigtjacketed into only a
|handful of ST games/applications that would run on a Falcon.
I was about during the rollout and I heard no such wide complaints.
Did I just nod off.

MEGS? That's trivial to some of the memory requirements advocated
by clones. You need 12 just to get NT running, or 8 to get windows
running with any decent response time. Again, the pc's are beginnign
to make the TT's look better & better...

I wont even get into what many pc'er themselves expect one to put
in one's machine to run a decent pc os...
|
|

|| |I am dedicated to NO computer. The purpose of a computer (to me) is to

|| recognition and intertia...
|
|Your naivete transcends my own and opens the doors to a deeper level of

|ignorance and intellectual misconstruction. What happened eons ago that
|got the MS-DOS computers rolling may have been "name recognition and
|inertia" - but that was 15 years ago. Today it is the value, the high
|performance (to the end user), the low price, the widespread availability
BULLSHIT! They just outlasted nearly every other competitor.
The superior competition were belittled as toys and game machines
until they ran into the ground and the pc-at clones became the toys
and game machines.
|of software. You'd throw all the good points in the toilet and scoff at
|it simply because it's not the most ideal design - ignoring all the
|benefits and totally disregarding the product. THAT IS WHAT I AM TALKING
|ABOUT.
It requires a P5-90 with 16Megs running NT to get the same
responsiveness as an 8Mhz ST running GEM. That is not merely
unideal but, it is fundementally flawed engineering and at that
price point, Falcons (oddly enough) are actually competitive.
Sure, you can get more hand holding, more slow bloated shrink-
wrapped apps but, unless you need to use special purpose apps
the pc has NO advantage. There are much more cost effective
game consoles out there.
|
|| Why not, when Microsloth is still living in 1981...
|
|Yeah, I could get 133 Mhz Pentium performance in 1981. I could get
|1280x1024x16.7 Million colors in 1981. I could get CD-quality 32-voice
|wavetable synthesis audio in 1981. These wonderful upgrades, somehow
|(miraculously), **DO** manage to function, even with a "less than ideal"
|processsor and OS. Do you disregard the fact that they do?
|

Yes, and all of that is still stradled over a 8088 memory
map...

Unfortunately, one cannot achieve the machine's full potential
with the dominant OS. So much of that horsepower will be
idle, wasting money...

|
|| Atarians are more like people who own electric cars. True that
|| technology was abandoned 90 years ago but, it's still more
|| progressive than ic engines...
|
|
|Now **THAT** takes the cake for a poor analogy. Not surprising that

>1.TT's have about 4 megs a second bandwidth to ST RAM, and about 9megs a second
>to TT-RAM - your average 486 has about 20meg a second to ram, 50meg a second
>to its secondary cache and >80meg a second to its internal cache.

Yeah, right. So now one wonders *even more* how this 486 manages to be designed
SO badly that it still loses from this supposedly super-slow TT030 when it
comes to real-life benchmarks such as actually *working* with applications,
instead of using -obviously meaningless- lists of figures, MFLOPS, MIPS et al.
For instance Calamus SL performs 2-3 times better on a TT, even with
CPU-intensive stuff, than any comparable package on a Pentium.
Believe me, I've been there, I've done that.
By the time your pentium can process, send and print a picture on a Fargo
Primera dye-sublimation color printer (A4, 300 dpi, 24 bit color without
rastering) in _anything_ under 18 minutes we'll talk again about it.

>2.TT SCSI has a max transfer rate of about 2megs a second, a $50 PCI SCSI2 card
>on the PC gives 10megs a second.

And still all poor deluded PC-owners continue using EIDE. It's a sad world...

>3.TT hard disk partition sizes are limited to 256 mbytes, even DOS allows
several gigs partition sizes.

Wrong. 512 MB without the need for any program, 1.0 GB with a better driver.

And don't start me about needing patches, 'cause that's a real joke:
Dos+Windows nowadays consist of only 8 % code and 45 % patches (and 47 %

helpfiles, and boy, you need `em, those helpfiles...)
Besides, with a computer where the OS, together with the most-widely-used-wordprocessor, take up 50+ MB of harddiskspace, of course you need 2 GB harddisks and more. I cannot even dream of filling my 850 MB harddisk although I do have more than 50 applications (and 900+ misc. programs), 500 fonts, 250+ .GIF/.TIFF files, some MPEG's, etc. stored on it.

>I could go on but your sort of mindless abuse of PCs is unjustified. Your
>comments about the '640k dos mem problem' show a major lack of awareness of

Maybe in the near future, but not as yet. Worse is the fact that a PC still can only access 64 KB ram at a time (paged-memory). Users don't suffer from this terrible fact that dates back to 1982 (!), but ask any PC/DOS/Windows-programmer about it and he will burst into bitter tears spontaneously. Fantastic, isn't it ? A 64 MB PC needs to have it's RAM accessed as a *thousand* different pages of 64 KB size, Ha Ha.
Yeah, Beavis, great computer this is. It really sucks like hell, Uh-Huh-Huh.

>the current state of the PC world - which is heading towards an NT/Windows
>based OS, with Windows 95 being the first stepping stone.

It took you long to get there, ain't it ? All other systems are running good operating systems since the mid-eighties. Oh well, I guess this goes with the territory, you buy what you're told and believe everything they want you to.

>Personally I own both a Falcon and Pentium based PC - the Pentium based PC
>can emulate an Atari 30% faster than the real thing, I guess this must be
>down to a poor design...

Oh yeah ? try `emulating' this then: Cubase Audio.
Considering the 486 you mention, your Pentium should have >65 meg/s to its secondary cache and at least 10 meg/s to harddisk. Right ? These are your own figures, remember ? So how come the Falcon can record and playback up to *sixteen channels* of 44.1 KHz, 16 bit digital Audio whereas your F*cking Pentium State-of-the-Art machine cannot even do 4 channels simultaneously ? How come, since the specs suggest it could easily do 64 tracks ? Huh ?
Two words for you : Bad Design !

I would take the above benchmark with a grain of salt. Most
SCSI controllers I've seen start a 150 and go up quickly. Also,
clone scsi cards are notorious for being incomplete implementation
of scsi standards.

Personally, unless I had a first hand review of a pc scsi controller, I wouldn't consider
putting it into my system. I would be especially
cautious if it were a 'good deal'...

>:-)
>
>Roland.
>
>@CiX
>

That seems to be in the same ballpark as the Falcon. I have a
Quantum 540LPS and Ratehead runs about 1500k/s, my Segate Hawk
comes in at about 1440k/s. The same results are found with HowFast.
By changing the block size in HowFast,it looks like it would help you
set up your HD caching as you see a graphical line representing
both continuning and burst rate transfer. On my DX2/66, the ISA bus
using an Adaptdec SCSI controller was slightly faster. I connected
a Conner 250mb 3.5" to the Falcon IDE and saw an improvement over the
standard 80meg ~900k/s vs ~1300k/s. TOS measurements made with AHDI 6.06,
HD Driver 3.xx and the ICD pro driver with none showing any speed
```

benifit.
The same 250m/b Conner connected to my new VLB card in the PC with special driver runs ~4000k/b! Go figure. Now lets see, I think I can mount that VLB card in the Falcon case if I yank the powersupply..:)

549. MagicC Mac V1.2.2

Newsgroup: comp.sys.atari.st
Date: 1995-10-13 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DGDnM7.5I6@ridgecrest.ca.us>
Source record: 157669

When I first purchased MagicC Mac from Toad Computers,
the version was at 1.05. I had some problems with NVDI
and HiSoft programs. Jennifer has just mailed me V1.2.2
free of charge and I must say this version is a big
improvement.

To be short:

All of my HiSoft programs (DevPac 3, Lattice C5.60,Mon
dosen't work as it needs an 030 in DevPac and DP/DSP,
TruePaint True Image) now have their menus working
properly and work fine with MagicC Mac (They don't even
work right on my Mega and MagX!).

I purchased PowerPrint, and can now print to my HPLJ4 from
within Magic. (This has always worked).

Phoenix now works (renders Leximan in about 40seconds).

Atari Works, Papyrus, PageStream, DA's Vector simply fly.

NVDI loads in any screen size or color mode with out any errors,
however, I have yet to get a proper color pallet using 32K
or 16m color modes (with additional V-Ram). With Image Copy
or True Image, the pic's colors are all screwed up
(real technical) :). In 256 color mode everything looks great.
I would like some help here if anyone knows the fix.

Another thing I noticed is FPU support for the 040 (nice)
and, if you would think it possible, much faster. NVDI's
speed difference is not as noticeable now as it was in V1.05.
With the shrink/grow boxes off, screen redraws look like there
120hz (instantaneous).

A note on installation. I had to rename the existing MagicCMac
folder in order to get the new version to install. Any Auto
folder programs,Ease config files, or other items in the
old folder must be copyed over by hand (mouse) :).

This was just my first day with the new version, and will
post any more compatible software I find. (if anyone is
listing) :).

If you have an 040 Mac at home or at work, this really is a
must have. It at least keeps you happy until you get home to
you beloved Falcon :)

(The Mac is a Quadra 950/040/33/FPU- 28megs ram 2meg-V-Ram.
I will be soon downgrading to a 900 Logic board so I can
install the DiiMo Cache 040/50mhz-128k cache card I purchased.
DiiMo advertised this as being compatible with the 950, however,
it actually only works on a Quadra 700 and 900. Shame on you!)

>The documentation is sparse, but if you follow it you will get a STe system

Sorry, it's only a *ST* you'll get, but with Blitter.

>running in a X-Window session. Subjectively the system runs 50-70% slower than
>a STe, but not bad for a software emulation.

Are you sure about that? On my DX4-100, GEMBench reports 330% ST speed, while
the raw instruction execution speed seems to be somewhere around 120-200%
ST speed. I haven't tried any "real world" benchmarks yet (like compiling etc.).

As for the next version - I apologize for not having released it yet, I was
and am still quite busy at work and with personal things - thanks to Griff
it will emulate ST sound on several Unix platforms. A few bugs have also been
fixed, and TOS 1.0, 1.2 and 1.4 should work now. I can't tell you when it will
be released yet, but it won't take more than a couple of weeks (sorry).

Regards,
Marinos

Right, but AHDI will never install drive letters beyond P:, no matter
how many additional partitions might be on your drives. If it would,
desastrous things could happen (because GEMDOS uses some internal
data structures limited to 16 entries without doing boundary checks).

Ben, if you're not sure about the answer then don't bother answering.
The person asked how to contact as he had some questions about ST
Xformer. Your answer merely stated the obvious, as I "went to go work
for Microsoft" over 8 years ago. Old news. Yawn. Where ya been? Must
have cold Canadian weather on your brain. :-)

Next time your correct response will be to give him my email address and/or
web site so that he could actually ask me those questions and even
download the latest version of ST Xformer from there.

yeah, yeah, snotty answer. It's 5am. Can't remember last time I slept.

- Darek

Yeah - hundreds upon hundreds of clones being sold every day while most competing architectures have dried up.. Really crumbling.

> Fortunately, most of us have nice compiliers to partially
> insulate us from intel's and m$'s shortsighted design decisicions.

My point exactly.

> computing when building their system.

Piss and moan about it, but at least all the old software works on your 486. Try running all those old 520ST games (Toad was blowing out) on a newer Atari - like a TT or Falcon. Hell, some won't even work with newer versions of TOS. No product is perfect, is it?

> What makes you think it's merely insecure atarians. One doesn't
> need a Fuji to see truely backwards nature of msdos clones.

I see the "backward nature" when I run an *old* statistics or physics program (or even a CGA game) on my cheap-ass 486 and the thing actually runs. There's a flip-side to the coin. Once again, no product is perfect.

> |
> No we got spoiled by not being constrained by the dominant OS
> for our machine NOT straightjacketing us or preventing us
> from realizing the full potential of our hardware.

You got straightjacketed into buying MEGS of ST RAM and MEGS of TT RAM - a serious duplication of hardware. You got straigtjacketed into only a handful of ST games/applications that would run on a Falcon.

There are probably over ONE HUNDRED sellers of PCs. That's one player, eh?

> |
> Cars haven't been that significantly different from one another
> since the turn of the century. It's a bogus comparison.

That sentence **truly** demonstrates what a naive little fellow you must be. Automobiles have been in a constant state of refinement since their debut to this world. You're no mechanical engineer, that's for sure.

> rant rant rant... got to pc group and quit trolling...

Is this supposed to be a coherent sentence? I rather think not. I'd ignore it just the same if it were.

> Baaad analogy...

No, I believe you're simply too ignorant to understand what the analogy was really about. The simplistic attitudes of the PEOPLE (consumers) is what is analogous. The different products (cars, computers) are not analogous. I suppose you had to be told since you obviously couldn't figure it out for yourself. There. You've been enlightened.

> Your naivete is amazing. Do you live in the real world?
> MS-dos is a perfect counter example. Success through name
> recognition and intertia...

Your naivete transcends my own and opens the doors to a deeper level of ignorance and intellectual misconstruction. What happened eons ago that got the MS-DOS computers rolling may have been "name recognition and inertia" - but that was 15 years ago. Today it is the value, the high performance (to the end user), the low price, the widespread availability of software. You'd throw all the good points in the toilet and scoff at it simply because it's not the most ideal design - ignoring all the benefits and totally disregarding the product. THAT IS WHAT I AM TALKING ABOUT.

> Why not, when Microsloth is still living in 1981...

Yeah, I could get 133 Mhz Pentium performance in 1981. I could get 1280x1024x16.7 Million colors in 1981. I could get CD-quality 32-voice wavetable synthesis audio in 1981. These wonderful upgrades, somehow (miraculously), **DO** manage to function, even with a "less than ideal" processsor and OS. Do you disregard the fact that they do?

> Atarians are more like people who own electric cars. True that
> technology was abandoned 90 years ago but, it's still more
> progressive than ic engines...

Now **THAT** takes the cake for a poor analogy. Not surprising that someone who believes cars haven't changed since the beginning of the century would post such outlandish drivel. The battery technology isn't there for electic cars. A range of 50 miles. Poor cold-weather performance. Expense beyond your wildest imagination. Sitting on a huge bunch of batteries that could rupture and possibly explode in a collision. You know your stuff, alright.

James

The fact that they are dominant doesn't automatically mean they make the
best products. Remember Philips' V2000 and Sony's Betamax videosystems ?
However, VHS survived, but is was by far the worst system available.

>person having a mental age from 7 - 12 years. That is a completely

>What's the problem?

The problem lies herein that those programmers are forced due to
economical reasons to program for the technical most inferior system.
Of course good programmers can overcome those hurdles, but it gives them
much more headaches as should be necessary.

What's so wrong with dedication ? Do you also frown at people who
cherish their '56 Corvettes or Oldtimers ? They know perfectly well that
a modern Toyota beats the crap out of their old cars in every respect,
but they still love their `prehistoric' automobiles.

>I am dedicated to NO computer. The purpose of a computer (to me) is to

Yeah, but my computer serves me very well indeed now, thank you.

>Does "shooting down" at other platforms somehow (in the minds of these
>three) somehow personally help you to reinforce your decision to keep
>your Atari?

No, but admittedly, it does hurt a little to see an otherwise great system
go `down the drain' because the majority of users choose for an inferior
system, thereby creating such a massive monopoly for both iNTEL and M$
that all competition dies a painful death.
It's all bloody marketing, that's what it is.
Atari wasn't the greatest computer ever (far from that) but in the
eighties it was clearly steps ahead of PC's. The first CD-Rom drive *ever*
came from Atari, for instance, but it was so ahead of its time it was a
terrible failure. The same goes for Atari's Transputer Workstation, the
first affordable workstation with multiple parallel processors (1988 ?).
The list goes on and on. I know this is ancient history, but it shows
how a very progressive and advanced system is killed by true mediocrity.
Or do you know of *ANY* innovation in the computerworld that was actually
invented by iNTEL or M$? I cannot think of _anything_, really.

Indeed, most of the time they went *backwards* instead, when good standards
were already established: IDE vs SCSI, 16 bit vs 32 bit,
M$-DOS vs Novell/DR-DOS, commandline vs GUI's, Edlin vs EMACS...Need I go on ?

>Does emotional opinion snuff out objective, logical reasoning? I'm not

>the job done. Both serve me fine. Yet, one Chevy owner (highly
>opinionated) will claim that "FORD SUCKS" and another Ford owner will
>claim that "CHEVY SUCKS."

PC's do not suck, but they *do* have more drawbacks than any other system
if you look at it from an objective point of view. The sheer processing-power
of a Pentium hides all the drawbacks and deficiencies from people that don't
take a closer look and only go for the glamourous presentation and the
b*llsh*it they're told by most computerstore's staff.

All this may be true, but do you care to reply to the issues I raised
above, notably that PC's may be better *now*, but they do not deserve
to be the world's standard because they have been way behind and will
continue to do so. Take a look at Windows`95 and you'll see what I mean.
I do not like to use a system that is conservative and crippled by nature,
I'd rather go for a brand (outdated, sure) that was truely innovative once
and very flexible, reliable and elegant. And that's my own good right.

By the way, did you know that the leading manufacturer of midi-sequencers
(Steinberg, of Cubase) *to this day* declares an Atari computer to be the
most stable, user-friendly, well-designed and cost-effective platform
for recording music of any kind ? Considering this is a ten-year-old
architecture, it says a lot about how good Atari's really are.

>Who knows what else? I'm no psychologist, but I don't need to be to

>to their Beetles that they couldn't see nor smell the changes in the
>marketplace. Sounds like the attitudes of some Atari owners, if you ask
>me. They must still be living in 1985.

Why don't you leave people alone if they're happy with their respective
automobiles/computers ? Isn't that a *true* sign of insecurity ? I'm not
trying to convince you to buy an Atari, I'm just saying it suits me fine.
Why do you keep on about us needing a new, `better'(?) computer then ?

Source record: 157685

Ok, let's get some facts straight. If I try to repeat what was said before then this thing will be to long.

Intels and Motorolas are as different as night and day. It appears from the user of the 68K that the Intel architecture is half bent backwards. Here's why:

- Intel is little-endian, 68K is big-endian. It's a way they store words. When the 68K stores $4E0C, then Intel stores it as $0C4E.

- 8086 and up has two seperate buses for write and read detect while the 68K use on for both. This appears not to be a limitation.

- In order to process same one line of instruction for the 68K, the Intel has to process TEN lines. This is why on a 486DX 66, you can only emulate at the speed of a 16Mhz ST. (This is also why ppl complain that Genulator is slow because they compare it to a Pentium. Screen speed can be fixed with programs.)

For me, I prefer to work with the 68K because it is efficent and you can carry it over to the RISC processors in the next generation machines.

But why I said I'm getting a 486(AMD thank you) is because over other reasons. Two years ago, I was all pro-Atari and thought the PC was a total joke.(Now I think it's mostly a joke)

See, if Atari Corp still supported their comptuer range then I would rather buy a Falcon. But because of the policiesof the Tramiels, I have to get a PC not only for my needs as a student of computer science but also to play any new games(I wanted the Jag to succeed but I guess they didn't). So right now I ask myself, should I upgrade the currrent ST I have or get a $1600 486DX4 and use Gemulator. At least with Gemultor 4 I can still develop games on it. But I can also use Turbo Pascal which my school teaches(though I can get Personal Pascal but it is way over $200 mostly for a big German manual.)

So gee, with the way Atari just dropped ST support completely, never carried through with the Falcon, and has made Jaguar a laughing stock of the game industry...any wonder why ppl moved on the "inferior" computers?

But I believe that the ST will live on but in many different forms. Some newer ST compatibles will be the German clones, and some will be emulation programs for the PC or Mac's. And there are those will will still stick with the Atari computers which I do respect. All I ask is that alternitive OS's, like TOS, are given a chance.

As for the guy who said that we are moving into the 32-bit Windows enviroment, I say you still have to deal with the old DOS architecture for the sake of compatiblity. And I don't know if I really want to give any type of revenue to Micro$oft for their shameful pratices. If I can run 32-bit Windoze games(which will hopefully replace the DOS ones) on Linux then I want that system installed. DR DOS can be my 2nd OS as well, though it will be nice to use a GEM interface on it.
(Anyone know where I can contact Digital Research?)

And that's my 2 bucks worth.

Eric Noss

(Any replies please just use the ones that you need to respond to, thanx)

>ending up in my STalker window). Does this sound familiar? Is it

What ? Tell me I misunderstood you. *Never* run two comms programs
simulaneously as they will evenly divide all the received characters.
Stalker must not run (or even be loaded) when working with STiK and
STiK *must* be disabled when running Stalker.

>most likely with the Slip system here or what? Thanks for any help.

Aha. That's your problem. STiK cannot cope with CSLIP. Disable it.
Ask your provider for ways to-.

If your ST won't use standard 720k MSDOS formatted disks, you might have some sort of drive alignment problem (as it should work). You might try formatting some disks with ps2form.tos, which produces very "compatible" MSDOS disks (more so than other formatters, in my experience). Ps2form is available from atari.archive.umich.edu.

Looking at it from another way, it might be easier for you to get the computers close to each other and null-modem the files over (it sounds as though this will be a one-shot deal). Heck, you could even borrow two modems and do it that way. There are shareware telecomm programs available for both Mac and ST that could do this quite easily.

>use on stereo track at a time? If so - that was stupid!

CAF always records stereo files to channels 1 & 2 ("Any"). So go into the
Audio Editor and move the stuff in tracks 1 & 2 to any other pair of tracks
prior further recording. Use "Shift + move" for locking the move
direction (takes practice - use undo if you fail), and set snap to "off"
before you move. This way there will be no shifts in timing.

It's best to always keep tracks 1 & 2 empty, because also the audio mixdown
goes there. It's a real pain in the butt to change channels later, if you
have done a lot of mixer automation.

: to set up a Unix-like file system... I just want to get
: things done, as easily as possible. From this point of
: view, almost all MiNT-software is almost useless to me,
: and people who think the same way.

The 'ease of use' depends on what you are and do. If you're
a programmer, unix offers things that other machines (until
lately) haven't, like memory protection etc. Of course GUI
would be nicer, but there are several things to consider:

- Although GUIs are much easier to learn (they provide the alternatives
visually and offer more user feedback), they normally aren't any faster
to use (unless it's a question of a graphics program).

- GUIs are a _lot_ of work and GEM is a very primitive from
the programmer's point of view (if you're using windows). And
GUIs don't add any new functionality to the program itself.
On a small program, the GUI part can easily be more than half
of the program code. Then you start to think about how much
time you'll put into a _free_ program to get it to work versus
the time you'll need for implementing a cute interface for it...

I'll promise to do some new GEM program, if somebody non-programmer
translates the E_GEM GUI library documentation from german to english.
It's only some 200K of text. Bigger programs have easily as much
code, but writing such a program is a lot more time consuming than
the trivial task of converting some text (I myself don't understand
german)...

I'll rub your back, if you'll rub mine. That's the way these smaller
computer communities are supposed to work :-)

: No, I don't think you mean that at all. But the times of
: old DOS are (and I think, should be..) over. Today's programs
: have to be user-friendly, intuitive, and they shouldn't
: expect the user to make any higher magic in order to get them
: functioning IMHO...

Have to? Should? Are you speaking about commercial software?

: I'd hate to see Atari-platform turn into a cryptic half-Unix,
: half-TOS chaos. Well, some people might like that, no doubt.

I partly agree. When reading some things on the MiNT mailing list,
I can just wonder why _everything_ has to be done like on normal
unix? What about Plan-9 OS? <g>

Sorta, there is STonX, but this is for Xwindows systems. This would require
Linux on a PC. There is a link to the STonX home page on
http://micros.hensa.ac.uk/, I don't know of any PD/SW emulators for
DOS/Windont.

589. STonX newbie success

Newsgroup: comp.sys.atari.st
Date: 1995-10-14 00:00:00 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <45p7tm$sjm@news.fsu.edu>
Source record: 157558

STonX is cool! I just installed it on my Linux box, and it worked on the first try. I used WinX to burn a TOS image from my MegaSTE, and encountered no problems whatsoever (I'm using the Linux binary distribution). Here are my GEMBench numbers:

```
==========================================
ST TOS 2.06, MiNT not present
Blitter Enabled, NVDI not present
Video Mode = 640 * 400 * 2 Colours
FPU not present
Run and Malloc from STRAM
Ref = ST + Blitter + FPU, ST High
STonX 0.4, 133mHz Pentium
==========================================
GEM Dialog Box: 0.725 758%
VDI Text: 2.055 269%
VDI Text Effects: 5.850 252%
VDI Small Text: 2.360 257%
VDI Graphics: 6.640 354%
GEM Window: 0.545 296%
Integer Division: 0.625 2880%
Float Math: 3.360 22%
RAM Access: 0.910 692%
ROM Access: 0.930 677%
Blitting: 0.460 397%
VDI Scroll: 1.315 325%
Justified Text: 1.835 296%
VDI Enquire: 0.745 356%
New Dialogs: 2.060 351%
==========================================
Graphics: 355%
CPU: 1067%
Average: 545%
```

The author mentioned something about having to divide these numbers by two in some cases, but even then they are impressive. I'm sure they'll get better when I get NVDI installed. This is on a 133mHz Pentium, ASUS PB-SRAM cache motherboard, Diamond Stealth 64 VRAM video, BTW.

Those that have access to a UNIX system should definitely check this out. For more info, see http://www.complang.tuwien.ac.at/nino/.

Hello,

I was wondering if any one would tell me how to take
downloaded atari programs from a pc save them to a
floppy, and load them into my 1040 ste ?
I know it can be done as someone did it for me once,
but he didn't tell me how, and I can't seem to get my
ste to read dos formatted disks.

Many thanks,

-ARIK- Implosion Studios at pnf@dana.ucc.nau.edu

Hi,

I'm sorry to post this here, but i'm desperate :) I lost my copy of Frontier, as a whole, and i'm beginning to get retraction problems :) I only had it for a little while, and i _REALLY_ want it back :) Can someone in holland either tell me where i can buy it, for i have been unable to find a store still selling it, or sell (or give :-) me their copy ? I still had soo much to do in it :)

BTW, was there ever a fix to make it work with extra memory ? I have two ST's, two 1040s, one with 2.5meg memory. The 2.5 one has better graphical output (don't ask me why, it just is that way. the other one has terrible signal disturbance) but Frontier would never run on it...

Thanx in advance,
Thomas.

597. CAB problems - solved?

Newsgroup: comp.sys.atari.st
Date: 1995-10-14 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <45oc0n$1qc@gti.gti.net>
Source record: 157566

I've been reading some of the problems others have been having with CAB and/or STiK, with the "error reading" errors that occur when one tries to open a URL. The default answer seems to be "check the cache path".

STiK 1.07 was recently posted to the mailing list, and now, suddenly it doesn't work for me, either. Basically, I had the original distribution working fine, so all I updated when a new release came out was STIK.ACC and STIK.RSC. My configuration and dialling scripts stayed the same. I usually delete CAB.INF before running CAB, so I can make sure that the paths are proper for my system, and no external viewers that don't exist are not defined.

IRC works, so it must be something with CAB itself. When running CAB, if you choose the "About CAB..." option, it identifies the TCP/IP stack as STiK etc. This time, it didn't identify any routines, so I knew that something else was at fault.

Now it seems that CAB.OVL is not included in the WWW107 distribution. This seems to be the wrapper that lets CAB talk to STiK, and is required for CAB to work with STiK (I guess a new CAB.OVL could be written to run CAB under MTOS?).

I also recall reading somewhere that the main reason for the fast release of new distributions was that CAB.OVL was rewritten (recompiled, changed, or whatever).

So is it safe for me to grab CAB.OVL out of one of the older distributions? Or is this just a file that accidentally slipped thru the cracks when the new distribution was put together?

Thanx

I am looking for video files, these would presumably be videomaster or
vidi st or whatever, 16colours maximum to be used on a bog standard FM,
frame size would be a quarter screen eg:80x100 (about?)
No sampled sounds are needed in the files, maximum file size 400 to half
a meg please,

The files are wanted for use in a Public Domain game I am making,
subject matter can be just about anything apropriate for general distribution

No profit will be made from this game that is aimed at STE/FM owners,
all credit will be given to suppliers of vid files used, unless requested
otherwise,

Either send encoded file to me or e-mail me for more info first, I dont
have any video grabbing hardware/software, so your help will be greatly
apreciated :)

Thanks!
Tony Greenwood.

>Yahoo etc. I gather it's planned for future versions, though.

Sure you can. HTML forms do nothing more than request another URL with
the parameters you filled in the form. So if you find out the
format of the parameter strings (look at the source of the form pages)
you should be able to search etc. It's a bit complicated but it
works.

1. Check if the set cache directory is valid
2. Check if you are using a SLIP connection. Many people
have CSLIP connections (compressed SLIP) without knowing.
STiK does not support that.

You guys probably use CSLIP connections instead of SLIP. STiK does
not support compressed SLIP. Talk to your provider.

IIRC, TOS 1.4 will automatically install a cookie jar. You will only need a
cookie jar installer if the one you have is too small...

The morons are not to be found at Intel. If a firm builds CPUs carrying
with them the company's history since the 4004, and the market buys them like
mad even though there is more advanced stuff around, I know where the morons
are...

How funny. Zip tools are only available for Mac and Windows, AFAIK, how
shall one use them sensibly under Linux, TOS, AmigaOS, etc.?

The question remains: what does a program have to send to the ZIP drive to
change the write protection of the media?

TOS versions older than 1.6 have a limit of 16Mb GEM partitions.....
AFAIK all TT TOS
versions can do 32Mb GEM partitions.

I think the problem you are having here is that the C: or the bootdrive
drive _has_
to be a standard GEM partition..... not a BGM.

hope that helps.....

I think I have a similar problem. I can login, but when I try to use
CAB, I can't do anything. If I use the hotlist or manually type in a
URL, the popup window appears, first resolving hosts, then making
connection, but then, while it is Receiving data (0/0 bytes), it just
sits there.

: I hope I can get this working.
: -scott tirrell

Hi Scott,

Why are you using STalker ? You don't need an extra comm program for running
STIK/OVL/CAB. STIK does the calling up and SLIP business - just set the
baudrate right and go. Make sure you login the way your base wants you to
in order to get a SLIP connection, make sure the FIND-RESPOND prompts in
DIAL.SCR (you have to edit it)are right and to get the right IP_ADRESS set that FIND-string
to the last word
your server sends out *before* the IP adress number. You can find out what
the word is by logging on with Stalker (then you'l see the prompt) but
you shouldn't need it later. It will work if you're provider supports SLIP.

Cheers,
Martin

STiK (I think) was written and a few programs altered to work through (with ?)
it. It seems you have STiK running perfectly. After it has connected it SHOULD
just disappear. What you now do is load one of the programs designedto work
with it. Once loaded these programs run fine, STiK just stays in the
'background' working invisibly (Nb. you WON'T actually ever see stik). When
you've had enough, just quit the program and then select disconnect from the
STIK accessory.

The programs I know about that work with it are:

IRC (in the EXE folder supplied with STiK).
and HTML Browser aka CAB.

If you want these then look for an archive called WWW107.zip

If you've got anymore questions or are unsure about the above, then email
directly !!! Its more likely to get read sooner. !

630. Re: Spectre and MacTCP?

Newsgroup: comp.sys.atari.st
Date: 1995-10-14 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <45ohra$iea@usenet.INS.CWRU.Edu>
Source record: 157700

I also can't get mactcp to work with spectre (or GCR). I have used sys6.05, sys 6.07, and mactcp 1.1.1 and 2.06, and interslip 1.01 and the latest version distributed with the CWRU interslip package. On bootup, the slip ICON has a big fat "X" thru it. under 6.05, I can write a working script for my local CWRU slip, It dials, says "connected" and then give a black bordered "interslip has quit unexpectedly" and dies.

If anyone has any ideas, I would love to know, too.

Boris D. Cahan
bdc2@po.cwru.edu

631. Move files from st to pc !?

Newsgroup: comp.sys.atari.st
Date: 1995-10-14 00:00:00 UTC
From: wolf <wolf@fmi.uni-passau.de>
Message-ID: <45n3g7$avh@news.rz.uni-passau.de>
Source record: 157701

Hello (everybody),

maybe someone of you might be able to help me. I need to
move some (more or less important) files from an
Atari St (could be 1040 ??) external Harddisk to a
"normal" (should I say: usual?) PC.

Is it possible to connect the St's external Harddisk to a
normal SCSI-Port (like adaptec...) or do I have to use
Floppy-Disks?

Please post answers to this newsgroup, or send me an
e-mail:
wolf@fmi.uni-passau.de

I've also got my own homepage (since 2 or 3 days ;-))), and
of course you can use it to contact me.

Ok, thats all - thanx
Andy.

633. WORM DRIVE ON ICD H/A ??

Newsgroup: comp.sys.atari.st
Date: 1995-10-15 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10151995.055744@empyr.dircon.co.uk>
Source record: 157453

Hi, Does anyone know if I will be able to get a SCSI W.O.R.M. drive
to work with my ICD AdSCSI+ Host adaptor ?

I have plugged it into the SCSI chain and the ICD software informs me that
it recognised the drive as a W.O.R.M. unit, although I suspect that this
is just relaying the info from the drive itself, and does not neccessarily
mean that the ICD interface can actually handle the drive.

I have been told that I would need special driver software if I was using
it on a PC, something to do with the system wanting to update the FAT
tables when you add files to the drive, which being write-once, would
cause all sorts of havoc with it creating multiple FAT tables.

So.... will the ICD handle it correctly, or would I need special drivers
(in which case I may as well use it as a doorstop, 'cos you can guarantee
that there won't be any for the ST !)

All replies very gratefully received.

Cheers,

Kevan.

635. GAMES ON HD ??!!??!!

Newsgroup: comp.sys.atari.st
Date: 1995-10-15 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10151995.193603@empyr.dircon.co.uk>
Source record: 157455

Hi,

Is there a reliable way to get games from floppies running from the hard drive ???

I am getting *REALLY* sick of waiting for the damn floppy to chug away, loading data that would be into the ST in a fraction of a second if it were coming from the hard drive.

Please, no flames or moral lectures on copying, I only want to play the games without getting grey waiting for them to load !

Besides, I doubt very much if any of the games companies would be the slightest bit interested in the ST, or the copyright of any of their titles for it by now.

PLEASE ! Can anyone help ???? !!!

Cheers !

Kev.

Let's see with I have this right...You want to run an ST emulator on an ST?? :O

I can see your point with you want to use Jet(MiNT on the Mac) or maybe run GEM programs in a window under MiNT but...

This one absolutely takes the cake!!! :)

I got that ish of ST Format just for the coverdisk. Forget it, it's a piece of garbage. See, I was taking a Pascal course at the time and the only way I can work at home is that I call in the VAX computer lab and use VMS Pascal. I tried using my sucessful programs from the VAX on Personal Pascal and none of them will run right. The editor is really long in the tooth, I prefer to use Edith(though it wasn't possible due to memory). If you need a ST languge that's compatible with Turbo Pascal, get Pure Pascal. I should warn you it's about $275 and all the instructions are in German. Sorry for shooting you down, but I had to tell you from my experence.

Updated: 10/15/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
I can not keep up with the newsgroups, so please use one of the below
ways of contacting me.
You can contact me at:
BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
WWW: http://www.lm.com/~asmodeus/
there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on
an idividual basis per order. All prices are in US Dollars, and payment
is to be in US Funds. Money Order payments will be shipped the day
after I receive payment, and personal checks payments will be shipped when
the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.
COMPUTERS:
1040 ST/F 1meg memory $130.00
1040 STE 4megs mem. $300.00

MONITORS:
Color Monitors atari brands $100.00
Color Monitors atari brands $100.00
(P) Color Monitors(broken, power box) $25.00
SM124 Mono Monitor $75.00

STORAGE DEVICES: (Hard drives and Floppy)
Indus GT External 720k Floppy $70.00
Toadfile 130meg + 80meg HD w/ICD+ host $250.00
ShoeBox 80meg HD w/ICD+ host $110.00
20meg shoebox, atari adapter $90.00

OTHER HARD WARE:
WICO Bat-handle joystick (9-pin) $10.00
Epyx The Grip joystick (9-pin) $10.00
The BEst TrackBall $20.00
The Cordless Mouse (Practical Solutions)$30.00

Mouse Master $20.00

VIDEO:
Video Key $30.00
ST Video Digitizer $15.00
The Complete Colour Solution (Sold ONLY as a set)
(Vidi-ST, Vidi-RGB and VidiChrome ST) $90.00

AUDIO:
Stereo Replay audio digitizer $85.00
ST Sound Digitizer (Hippopotamaus) $25.00

PARTS:
2 assorted Atari internal floppy drives for parts $8.00
1040 case and rf shield $10.00
4 Atari 256k Simms from Ste (Make Offer) $35.00

Get the newest STiK version (www107.zip). Under "other stuff" you can
set the IP address manually.

Use SLIP instead of CSLIP (see below).

>IRC tells me that the HOSTNAME is not set, but in DEFAULT.CFG the hostname
>is set by "HOSTNAME = on-luebeck.de".

Maybe you should set it to goosie_u.on-luebeck.de

>BTW: Where can I set the netmask and how can I change between CSLIP and
>SLIP ??

That depends on your provider. Maybe you can't do it yourself.
In my case I log on with the prefix "SN" for SLIP and "S" for CSLIP.
Ask your admin.

641. For Sale: TurboJet $20 (HP printer driver)

Newsgroup: comp.sys.atari.st
Date: 1995-10-15 00:00:00 UTC
From: ggreenbe@mailbox.syr.edu
Message-ID: <45s489$qic@newstand.syr.edu>
Source record: 157588

I have a copy of Turbojet (v 2.0) I would like to sell for $20, shipped to you (within the US or Canada). This is a GEM printer driver for the ST to work with HP LaserJet & DeskJet Printers. Since the package was put together in 1991, it may not work with the latest HP printers. The manual states it will work with "HP Deskjet ink-jet printers [I personally used it with a Deskjet 500] or HP LaserJet, LaserJet Series II or compatible laser printer with at least 512 graphics memory for full page 300 dpi graphics. (1 megabyte of graphics memory may be required for complex pages, but most pages will print with 512K.)" I cannot guarantee that it will work with any HP printers that were made after these were.

If you're interested in this driver, send me email at ggreenbe@mailbox.syr.edu.

Thanks,
Gerry

From: dwight@zip.com.au
Message-ID: <45r2bu$ui1@zipper.zip.com.au>
Source record: 157591

Is there a comms program for a ST1040 with medium res screen? If so is there an ftp site (preferably in Australia) that has it?

Many thanks.

(Oh, yes the ST only has floppy drives - 720KB at that...!!)

This is for a friend who is trying to setup comms to send 'email' to Indonesia...

Bye
Dwight

645. SLM605 and SyQuest 270

Newsgroup: comp.sys.atari.st
Date: 1995-10-15 00:00:00 UTC
From: cl152@cleveland.Freenet.Edu
Message-ID: <45rhd4$8fh@usenet.INS.CWRU.Edu>
Source record: 157592

I just purchased a SyQuest 270 and LinkII to use with
my MegaSte4. It works fine when it is direct plugged into
the DMA port but neither the internal or external drive
is recognized if it is plugged into the SLM605
controller box. Plugging my old MegaFile 30 into the controller
box does work. So the port on the controller box seems to be
okay. Anyone have an idea as to the problem. Anyone have a similar
setup that works.

Thanks

RE: realloc

ANSI standard 7.10.3.4 says:
---begin quote---
void *realloc(void *ptr,size_t size);

Description:
The realloc function changes the size of the object pointed to by ptr,
to the size specified by size. The contents of the object shall be
unchanged up to the lesser of the new and old sizes. If the new size
is larger, the value of the newly allocated pointer of the object is
indeterminate. If ptr is a NULL pointer, the realloc function behaves
like the malloc function for the specified size. Otherwise, if ptr does
not match a pointer returned by calloc,malloc,or realloc, or the space
has been deallocated by a call to the free or realloc function, the
behavior is undefined. If the space cannot be allocated, the object
pointed to by ptr is unchanged. If size is zero and ptr is not a null
pointer, the object it points to is freed.

RETURNS:
The realloc function returns either a null pointer, or a pointer to
the possibly moved allocated space.

---end quote---

Note well that even if q below is not a null pointer, it does not have
to be p! In fact p could be moved and the old p freed, as per above and
all is well, except your assumption that q==p.

p=realloc(NULL,10);
q=realloc(p,20);

There results assuming p!=NULL are one of three cases:
case 1: q == NULL; /* memory needs to be moved, and new memory can not
be found . result p is ok, but size is still 10 */
case 2: (q != NULL) && (q!=p)
/* memory needed moving and was found. q points to legal entry.
p no longer does. size of entry is 20. */
case 3: (q!= NULL) && (q==p)
/* memory could be extended and was, size is now 20, in the same
place as p. */
```

: there an ftp site (preferably in Australia) that has it?

I am using "CoNnect" on my 1040st and as far as I am aware, all comms packages will work on a 1meg machine simmilar to your friends, do not believe all the hype telling everyone you need megs of memory and a hard drive, thats rubbish, it is better with more memory and more disks space but not neccasary, the only software I have is a comms package, yet with my provider I get e-mail, www browsing, ftp, gopher, this newsgroup and a choice of over 12000, others, I can do anything anyone else can, I can only do it text, for instance when browsing the net, all I get is terxt and no pictures, but hey! what the hell, its quicker when its just text :), now with STiK i also get IRC (thats what comms is for), all this and a lot more, all for 10ukp a month and all on a 1040st :)
So simple get any comms package, as you are accesing the net then an ftp site in Australia is surely irrelevent, go to any site in the world, just search "atari"

Just felt like having a voice ?

651. Help me with Stik/Cab!! Please!!!

Newsgroup: comp.sys.atari.st
Date: 1995-10-15 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <hlOkA+E.johnhechtman@delphi.com>
Source record: 157598
Body handling: HTML body converted to readable text

This is an open letter to the authors and support people of Stik as well as any folks out there who may be able to help me get it working. I've tried every released version of Stik/Cab from 101 to 107 and _still_ can't get into irc or get Cab to work online!

My Internet provider here in NYC is Panix, a company that's been around for a long time with a good reputation - but I'm beginning to think there's something odd about their implementation of SLIP. Some of the online posts said that Stik will not work with CSLIP (compressed SLIP). However, when I talked to Panix they said their SLIP was "auto-sensing" and would provide either SLIP or CSLIP according to what the web browser needed. Tim Newsome said that his provider also used "auto-sensing" SLIP and he had no problems with it. Is there more than one implementation of "auto-sensing" SLIP?

I've followed the instructions on how to set up Stik/Cab and Tim N. has sent me several letters with suggestions to try different settings - but so far to no avail. It seems as if I have Stik working properly, as it dials in to Panix and I get the "connected" prompt with no problem.

However, when I try irc.prg I'll get the "resolving host" prompt followed by the black-boardered command line at the bottom of the screen, so I assume I'm part-way connected. But when I try to do something - like /join #atari I get bounced out with the following messsage:

Error: Closing link: johnnyc (166.84.199.109) (no authorization)
:TCP_Close () returns: EOF from remote
IRC session closed

Start another session Y/N?

I've tried changing to another irc port (MIT) with the same result - I get bounced out every time :(

When I go online with Stik and try to run Cab, it seems to work and I get the "connected" prompt. Stik also shows my IP number correctly and not the $GET_IP prompt. However when I try and run the Cab.prg, I get (sometimes) the prompt "resolving to host" and then "receive data 0/0 bytes". Then it hangs up and I can go no further. Sometimes after this, I get an "error in opening file" followed by the file name and webpath. This happens even with www107 - it just happens faster. However, when I try opening one of the test HTML docs in the new package, Cab does it perfectly. This is what leads me to suspect a problem with Panix.

I've done the following operations to try and get everthing working:

1-Put a folder on my C (boot) drive called "wwwcache".
2-Assigned that folder as a path in Cab
3-Copied the folder "stik_cfg" to my C drive along with all the files in it.
4-Edited (many times) the default.cfg and dialer.scr files in the stik_cfg
folder. I've tried all the variations Tim N. suggested. See <>
in my appended files.
5-Put Stik.acc in my Acc. folder on my C drive. I use the patched version
of Chameleon as an acc loader. One post online said that other people
have gotten that to work. I've also tried running Stik as a normal acc
from the root of C drive with no change in the symptoms.
6-Set and saved the following in Cab:
A-Install fonts - no GDOS, so I set to system font.
B-External viewers - only set STGuide for text and HTML - left others
blank to get default.
C-Set HTML folder for the one in the www107 package on my I drive.
D-Set cache for my Mega ST4. 512k ramcache w/256k free. Set HD cache for
2 meg on C drive - I know that's small, but I'm short on space in here!
E-Set display options - I'm in mono, so it's simple
colors = white background/black text
links = bold and underlined
images = display on/monochrome mode
text instead of images = no
text width = fixed
7-Copied Cab.ovl from www106 into the www107 folder as for some reason it was
not included in www107.
8-Put and renamed the Cab.rsc (English) file in the Cab folder, so the prg
would run in English (thanks guys!).

Despite all this, the bugger still doesn't work for me. I don't think my
problems are hardware related - I have a Boca 14.4 modem into a Mega 4 with
TOS 2.06 and it all works fine on every other online system I call, so my
problems must be in how I have it set up - unless they're with Panix (my
SLIP provider). But Panix has been around for years - and no one has said
anything about having to configure the provider in any special way.

I use hsmodem6 and according to the docs for it, I need only drvn.prg and
mfp.prg, as I have an STF and scc.prg is only needed for the STE.

It also seems that I'm not the only one stuck at this stage:

You guys probably use CSLIP connections instead of SLIP. STiK does
not support compressed SLIP. Talk to your provider.

Sacha Moufarrege, email: sacha@aslan.ruhr.de, Maus: @ DO2
RAI online: http://www.ruhr.de/home/aslan/rai/rai.html

And here we are back again at the CSLIP/SLIP thing where "auto-sensing"
SLIP works fine for Tim but not for me and perhaps some other folks as well.
Can anyone help me with my problem? I've spent _days_ trying to get this
package to work!!! Thanks to all in advance for your help! :) :)

Make sure the DOS disks are 720K not 1.44M, and it should work.

Good idea! And while we're at it, several of the postings here (Re:Atari
Pride) would be more appropriate in comp.sys.atari.advocacy.

>
>TOS versions older than 1.6 have a limit of 16Mb GEM partitions.....
No, they don't. Well, hold it, you're right with GEM partitions, i.e
partitions with the marker 'GEM' in the root sector of the hard disk. But
it is only a restriction of the hard disk driver to provide (or not
provide) access to BGM partition introduced with AHDI 3.0, although the
use of TOS 1.04 is strongly recommended.

>AFAIK all TT TOS versions can do 32Mb GEM partitions.
>
>I think the problem you are having here is that the C: or the bootdrive
>drive _has_ to be a standard GEM partition..... not a BGM.
That is not true. My C: partition *IS* a BGM and it worked ok for me the
last 3-4 years. I have to admit that this is on a Mega ST with CBHD,
which very closely works like AHDI.

>an XGM partition sector can contain a link to another XGM partition.

I see. But I don't think that the initial partitions sector mustn't have
more than one XGM link. Normally you do have only one link, indeed. But the
AHDI specification doesn't impose a restriction on the number of XGM links
in one partitions sector. The initial sector must have at least one GEM or
BGM entry, of course. Otherwise you wouldn't be able to boot from it.

This problem was fixed several months ago. (Remember the current version of
HDDRIVER is 4.04 and will be 4.50 by the end of this week.) But this was not
a bug but a feature. HDDRIVER "knows" the internal limits of each version of
GEMDOS (See the XHDI documentation for details of the XHDosLimits() call.)
The limit on the Falcon was lifted to 1 GByte some time ago. (Note that this
is a feature not documented by Atari. 1 GByte works, but it's undocumented.
For MagiC 3 this is documented.)

: > Any help any of you can offer would be deeply appreciated.

: If your ST won't use standard 720k MSDOS formatted disks, you might have
: some sort of drive alignment problem (as it should work). You might try
: formatting some disks with ps2form.tos, which produces very "compatible"
: MSDOS disks (more so than other formatters, in my experience). Ps2form is
: available from atari.archive.umich.edu.

: Looking at it from another way, it might be easier for you to get the
: computers close to each other and null-modem the files over (it sounds as
: though this will be a one-shot deal). Heck, you could even borrow two
: modems and do it that way. There are shareware telecomm programs available
: for both Mac and ST that could do this quite easily.

Randell Spreadborogh (zap@eskimo.com) wrote:
: I have a SH 204 ATARI HD with a dead drive mechanism. The rest is in good
: shape. What type of drive mechanism can I replace it with? Will any scsi
: drive work? Does it have to be mfm or rll? Does it matter? I would like to
: get a larger drive in the box if possible. Any help would be appreciated. My
: knowledge is limited on this subject. Thanks for your help!

With an SH204, you have two options:

- Replace the MFM drive.
- Remove the SCSI-to-ST506 controller (the Adaptec board) and connect
a SCSI drive to the SH204's SCSI hostadaptor.

Since the SH204's hostadaptor is pretty old and was designed in the
first years of SASI/SCSI, I wouldn't bet that a modern high-performance
SCSI drive would work (especially if it requires parity, of course,
which the SH204 simply doesn't support). If you go for a cheap, older
SCSI drive, though, you'll probably be a happy camper.

MFM drives are hard to get these days, and they are usually slower
than SCSI drives, but if you happen to get one cheap, it's the slightly
safer option.

There started a rift back in '85 of 68000-systems (ST, Amiga, Mac)
"against" the PC line. Back then, things were different. There were few
clones, PC's had shitty graphics and no sound. THey were slow, and wait
states, I need not go further. The ST was (1) faster (2) better graphics
(3) better sound (4) cost less. That's why it started, and for logical
reasons. Things have changed considerably, and many people (for some
goddamned reason) feel "loyal" to these machines and it prejudices them
against the fact that things have changed. I don't care about what
BILLIONS Intel has. The fact of the matter is that for the END USER, the
CONSUMER, regardless of how many BILLIONS Intel gets, when I can get a
LOADED "multimedia" system for a grand, it's the biggest bargain
(dollar/unit of PC performance) the world has ever known.

Also, big giants have commensurately proportionate number of critics and
prejudiced nay-sayers.

> Consider this: When was the last time you came across "a bunch of amateur programmers
PISSING
> and MOANING" about how bad Motorola chips are?

I haven't. However, this doensn't change the fact that as a CONSUMER, a
PC offers excellent value and bang-for-the buck. Most owners are not
programmers and the internal architecture and programming techniques and
shortcomings are of no interest to them. They buy software, the sale of
which pays programmers. Fortunately for the consumer, there is a
programmer to take care of them. Fortunately for the programmer, the
consumer doesn't have to learn to program, and creates a job for the
programmer. Thus, to the majority of PC buyers, who cares what's inside
the processor if it does the job at a low price and has scads of software
available. I wish someone would thoroughly dispute all points of the
sentence prior to this one.

> And I suppose you were the first in line to buy a YUGO because, after all,
> it couldn't possibly suck because it gets you from place to place for at
> an economical rate.

No, it lost out in the marketplace - kind of like the Atari line of
computers.

>
> >For your information, I am a very unpracticed, unskilled programmer.
>
> I know.

> >need to deal with SEGMENT:OFFSET registers - and YOU simply bitch about them.
>
> Actually, I program them.

Since I am the admitted consumer and not programmer, and you are the
highly-opinionated programmer, I put the quesiton to you: WHAT SOFTWARE
ARE YOU FAMOUS FOR? WHERE ARE YOUR PROGRAMS FOR SALE? WHERE CAN I SEE
AN EXAMPLE OF YOUR WORK?? If you're as good as you believe yourself to
be, then your work (even shareware) should demonstrate it. I rather
believe all I'll see from you is highly-opinionated hot air. You know
just enough about programming to bitch about it and form an arrogant
opinion, I'm afraid - UNLESS I CAN SEE SOME OF YOUR WORK.

[snip]

Oh, first we're talking about PCs then you jump to talking about embedded systems..... Let me clarify - as long as my microwave oven works or the EEC-IV computer in my Mustang, I don't give a shit about embedded systems. I was talking about PCs. You must have a hell of an exciting life and be a real breadwinner (what, $20K??) as the World's Greatest and Most Highly Opinionated Embedded Systems Programmmer. There. How's that for a title? Sorry, Embedded System Programming Magazine is too boring for me - I have no interest. I'm sure you have a pocket protector you ordered from the magazine.

Even a dumbass knows about Macintosh. Only a dumber-ass wouldn't know that.

>
> >Why must you place VALUE JUDGEMENTS in the arguement, such as "GOOD
> >DESIGN?"
>
> Because, unlike you, I am qualified to do so.

No, let me distinguish that from the truth: YOU *THINK* YOU ARE QUALIFIED. That's you're little pipe dream. See, I'm not coming in here pretending to be a ballsy know-it-all programmer like you. I am coming in here as a consumer who does not program, but who is capable of making an intelligent decision about which computer will serve me best. I need not give a damn about programming; there are programmers who do that for me. The difference is that you believe yourself to be an authority while I admit I am an end consumer. You'll no doubt go to any extreme to try and convince us all that you are an expert and that your belief about "what to buy" (based on whatever programming experience you claim to have) is the gospel. However, your testimony is irrelevant as I can get the most units of computing power per dollar with a PC in that sense, get a kick-ass computer (in the absolute sense), and get all kinds of software which is reasonably priced. The fact that the machine DOES EXACTLY WHAT I WANT FOR CHEAP is my criteria, so I made a wise decision to buy it. I cite all the other people who feel the same way and who have done the same thing - yet you attribute this to "the dumb masses" when many (including myself) are satisfied and got a bargain. I suppose it has to do with our differing perspectives: You are a slave to the computer and the computer is a slave to me. I don't need to worry about what it's like to be a slave to the computer and you do, so perhaps there is the basis for our differance of opinion. However, I won't sit idly while a know-it-all smalltime programmer tries to make me look like a fool for making what was a wise CONSUMER decision. If you want to program for a different platform (talking PC's since I don't give a shit about embedded systems), go ahead - but unless it's Macintosh, good luck and I hope you don't end up on welfare.

> equal resources devoted to each platform).

Back off and take a wider view: IT can be done (IT IS BEING DONE OR MY
COMPUTER WOULDN'T SERVE ME AS WELL AS IT DOES) on a crappy-to-program
PC, but it takes a better programmer. I guess you need not apply, then.

> If you have an ST you can see my name on the screen right away. One of

Hey - that's great. I hope if you ever reach an impetus, you'll handle
it better than you do the 640K barrier. I ask you this: Where, in the
hierarchy of programmers, does the embedded systems programmer lie? No
flashy graphics, no sound, relatively simple little computers, no credit,
masked in anonymity????

I think I'd take John Carmack (of DOOM fame) more seriously than you.
I've seen his work on the PC and it kicks ass. You piss and moan and
program embedded systems and tell me I'm a fool for buying a PC, and John
Carmack gets around these problems and PRODUCES quality software that
makes my PC do the things it should - because I am unable to program it
in such ways myself. At this point, I take my hat off to the fine
programmers that make such "miracles" happen (like DOOM and the GEMULATOR
and PC Xformer) and I hold an erect middle finger to the naysayers who
tell me I'm a fool for buying the hardware that runs such software.

Nobody is forced into any trade. If they couldn't hack it, or didn't
want to, I'm sure they'd find other work. I'm not trying to defend the
flawed PC architecture, but I would like to make that point.

> What's so wrong with dedication ? Do you also frown at people who

Agreed. However, if they drive their '56 Corvettes and go around saying
that new cars SUCK, then I'd have a bone to pick with them.

> that all competition dies a painful death.

Fortunately, Intel has its work cut out for them - fighting off AMD,
Cyrix, NexGen, IBM. Fortunately, the PPC may lay this entire DOSBOX to
death finally - in the future.

Keep in mind that buyers now don't arbitrarily choose. They still get
substantial value for their money. True-color photomorphing on a $1000
PC was a pipedream 5 years ago and reality today. I agree that there may
be a problem in the future with the Microsoft monopoly. However, how can
it be dealt with without compromising our capatalist philiosophy?

> terrible failure.

It was partially because it was ahead of it's time. I think you say
it best in your above paragraph, first sentence. It's all marketing.
Atari (post-Tramiel) could FU*K up the marketing of ANY product. Of
course, Atari didn't invent the CD-ROM (not by a long shot) and
attempting to rush into market with it could have been an edge for Atari,
but things didn't work out. Leave it to the Tramiels. I'm surprised
they were as successful at Commodore as they were - must have been luck

that made the PET and the Commodore 64 as popular as they were - or
someone GOOD was working for Tramiels.

> The same goes for Atari's Transputer Workstation, the
> first affordable workstation with multiple parallel processors (1988 ?).

They bought this system from (I believe) a British outfit? Of course, it
was for the most part more Atari vaporware. I wonder how many of these
are in existance and what software was available? Another marketing
snafu. IBM probably could have actually sold the thing.

> PC's do not suck, but they *do* have more drawbacks than any other system

That is (drawbacks) from a PROGRAMMER's point of view, not an end user.
Most purchasers of computers are end users.

Way behind? HOw do you measure? Screen resolution and colors? Sound
(i.e. nice wavetable card)? Price??? MIPS/dollar??? Megs/dollar???

> Good for you.
> Now leave us alone, okay, as we're quite happy too with what we've got.

Yes, good for me. No, I don't feel like I should have to leave since I
still use Atari hardware and software occasionally, and I want to be
here. However, the only reason I posted originally was because of all
the bullshit PC-bashing. You weren't just "happy too with what you've
got" - you were spouting shit about PCs, much of which was misleading.

I read the PC newsgroups and Atari newsgroups. If someone spouts
mistruths about an Atari, then I reply. I do the same here in the
opposite scenario.

> So did the *most revolutionary car ever produced*, the "Tucker"...
> A shame, isn't it.

I wouldn't compare what happened in the "Tucker" scene to Atari's
bumblef*ck of its computer line.

>
> Why don't you leave people alone if they're happy with their respective
> automobiles/computers ? Isn't that a *true* sign of insecurity ?

No, dumbass. The true sign (if you could read, or have you been smoking
out in the Nethrlands coffee shops) was when THE ORIGINAL POSTERS kept

lashing out against the PCs - and it was disturbing to me as I am
involved with both computers.

> I'm not
> trying to convince you to buy an Atari, I'm just saying it suits me fine.
> Why do you keep on about us needing a new, `better'(?) computer then ?

Once again, for your edification, I was replying TO SOMEONE WHO WAS
SPOUTING OFF ABOUT PC'S SUCKING. Try to get the facts straight before
you point that finger, ok?

I am looking for a net site that has an atari version of UUENCODE that is
a free standing file. I found UUCODE 4.0 on a remote sight but unfortunately
(as usual) I need to use uudecode to use it! Does anyone know of a site
that I might find the the exapandors and compressors in a *normal* fiLe
format--ie .ZIP, .ARC, or .LZH?
An aside...
hyperion.com seems to have many atari files but you need to uudecode
them....

Is there a way of converting Harlekin (a grab bag of programs like notepad, comms, wordprocessing, spreadsheet...) from hi res to medium res?

A friend has a 1040ST and wants to run Harlekin in medium res mode.

Please email...

Thanks to people answering my previous question about a comms program which runs in medium res for the 1040. I found a good archive at UMich:
atari.archive.umich.edu/atari/Telecomm

There weren't any in Australia that I know of.

Thanks
Dwight

First, you'll need an ST with a modulator. 520ST's have them and my 1040STE has one. Otherwise, you'll have to buy a scan converter (the Averkey sold by Toad is a good one but better prices are available).

The only software I know of for dumping animation to tape is CyberVCR. It will run Cyber seqs and control a Sony vcr. It comes with a cable that connects to the VCR. It's Sony Control-L, but the connector is the older 5 pin style. Just lop it off and put a mini-stereo connector on it and it'll control any of the newer Sony vcrs. I use mine to dump animations to my TR700 camcorder.

Get FREEZE DRIED TERMINAL!!!!! (anything you want to know about it ask me.)

You can get it at the major FTP sites like Umich or Hensa or whatever.

In fact you can probably get it from ACE in Sydney... I'm pretty sure
its on their BBS.

If you try loading the html files from the cache into a text editor like
everest, then do a replace <*> with nothing, you'll get a printable text
output. It might look better with some editing, but it's useable.

Of course, you could go the whole hog, load the edited text into Calamus or
Pagestream, then load the GIF's or whatever, make up the page and print it all
out..... Looks good if you've got the patience.

Try ESS-CODE 6.4 - you can ftp it from Hensa in /micros/tos/n/n172 (I think I got that right - once you're in it's definitely n172). The prog UU-encodes and decodes, as well as others, it's gem based, fast and pretty nice to work with!

Cheers - Andrew

I gave up trying to use MacTCP/MacPPP with Spectre -- couldn't get
past 1st base. More specifically, MacPPP would time out waiting for
a response to its first modem command -- *I* could see that the modem
was responding, but MacPPP couldn't. :[I decided it was probably
down to the fact that Spectre emulates only those modem lines which
are physically present in a MacPlus.

||
||
||| |Piss and moan about it, but at least all the old software works on your
||| |486. Try running all those old 520ST games (Toad was blowing out) on a
||| I don't give a rats ass about crappy software made when much
||| better ST versions were available or at the dawn of time. I'm
||| no stinkin IS cobol guru. 10 year old software is irrelevant.
||
||Pardon me, but there are still a lot of STs out there. The dichotomy is
||making a game NOW (or whatever application) that runs on BOTH. Sorry I have
||to explain this scenario to you and you had to go off an a "10-year old"

||tangent. To disregard backward compatibility as a benefit (yes, I know
||it has a price) as merely "wanting to run irrelevant 10-year old
||software" shows how all-or-nothing and ostentatious you are. At this

I will simply not put up with software from the pre-386 days.
For me this would simply be regressing from a standard I was
used to on the Atari ST.

Such far flung backwards compatibility is usually only relevant
on larger systems with significant program libraries in
fortran or cobol (or some other relic).

||point, I wouldn't be surprised if you tell us the moon is made of cheese
||to support your arguements.

It makes no sense for an ex-Atarian to run relic PC progs that
are inferior to their ST counterparts (that he used to run).

||
||
||| |newer Atari - like a TT or Falcon. Hell, some won't even work with newer
||| |versions of TOS. No product is perfect, is it?
||| I had very few programs that broke under rainbow tos and that's
||| the one that broke most of them.
||
||What about TT or Falcon?

Some examples would be nice...
TOSes, major progs that clash and cant be patched, things like that.
Or are you just blowing hot air.

||
|||
||| And yes I'll piss and moan about it. It's a valid gripe and one
||| that can't be so easily glossed over. It's truely pathetic to not
||| be able to use the rest of your 16Megs because of a design decision
||| in the OS to limit an enviroment space to a fixed amount of main
||| memory the size of an Atari 800+ (64K).
||
||Go piss and moan and let the capable program. Once again, I'm glad

The OS, the OS, the OS, you illiterate wanker.

Short of a new OS, the programmer can't do squat about the
GDI,USER segments in windows. And since you don't like
Win95 yet, this is a limitation that you also have to
deal with and unlike dos limitations there is precious
little you can do about it.

||others cease bitching and develop a workaround. I'm no programmer but I
||know enough about programming to say that PC software developing may not
||be for the meek. You need not apply. However, since the majority of

Those who do earn bitching rights; those who don't should
avoid topics they aren't qualified to comment on.

||PeeCee buyers are not programmers, and there are many programmers who
||make us great software, the problems are not "glossed over" - they're
||dealt with.

Only if you're a member of the billyboy fan club...

||
||
||| |I see the "backward nature" when I run an *old* statistics or physics
||| |program (or even a CGA game) on my cheap-ass 486 and the thing actually
||| |runs. There's a flip-side to the coin. Once again, no product is perfect.
||| Yeah, run a version of Double Dragon that makes the ST look like
||| a bloody Amiga. I bought the ST then because I didn't want to be
||| subjected to such junk.
||
||I haven't played Double Dragon - I don't like the game. I play Wing
||Commander III, quit playing DOOM a year ago, and mostly don't play many
||games now because I don't have the time. (Every once in a while I play
||Asteroids/Missile Command/Tempest to take me back to the old days).

You were the one who sang the praises of running those CGA
games...

||
||
||| MEGS? That's trivial to some of the memory requirements advocated
||| by clones. You need 12 just to get NT running, or 8 to get windows
||| running with any decent response time. Again, the pc's are beginnign
||| to make the TT's look better & better...
||
||I don't run NT; I don't need to. Not many people do. Fortunately, my
||computer (most DOS boxes nowdays) run standard SIMMS (does yours?) so if
||8 megs was such a big deal, I would have decided a computer was outside
||my budget. However, I am happy that the qty. of 8MB was available to me,
||and I wasn't limited to limp by only 1 or 4, or blow the wad on

I am not aware of any Atari based OS that requires 6 megs
to start itself in GUI mode. The savings there alone (less
bloat) would allow one to 'get by' on another machine
with less ram.

||14MB, and at a high cost for proprietary SIMMS. Now there's a formidable
||RAM expense because choices are so limited there's no middle ground.

You really need to keep up with the state of the Falcon.

||Now, what was that you meant with that last sentence of your above paragraph?
||
||
||| I wont even get into what many pc'er themselves expect one to put
||| in one's machine to run a decent pc os...

||
||Ooops - there you go off again jumping to your subjective value
||judgements with terms like "decent." I don't worry about things I don't
||need to; if a product works enough to serve my need, I find it "decent,"
||even if it's not "ideal." I like 8MB although some get by with 4MB.
||Nothing unreasonable there.

Only if you've used any other micro-platform on the market...

Atari spoiled me... '-)

Without a point of comparison, it's understandable that most
people don't realize what they're putting up with.

||
||
||| |
||| |
||| || |I am dedicated to NO computer. The purpose of a computer (to me) is to
||| || |serve me as does my television set, microwave oven, and automobile. I am
||| || |not dedicated to these devices; they are "dedicated" to serve me. They are
||| || |devices of utility and convenience. When any of those devices (computer
||| || |included) fail to serve me adequately, they will be replaced.
||| || |
||| || It is a bit easier shop around for other forms of electronics.
||| || For the most part they are not dominated to the same extent
||| || by one player as is the micro-computer market.
||| |
||| |There are probably over ONE HUNDRED sellers of PCs. That's one player, eh?
||| I was refering to microsoft and the PC-AT clone.
||| Chevette, Escort or Lynx... some choice. No choice at all...
|||
||| PC-AT clone #1 is much the same as PC-AT clone #101...
||
||Except that PC-AT clone-maker #1 is in competition with PC-AT clone #101
||and the product is homologous, under which circumstances competition
||functions best. The result is bargain prices - big bang for little
||bucks. Congrats on citing the biggest reason to own a flawed PeeCee -
||they're cheap. Perhaps you've uncovered the reason, albeit without your
||knowledge.

Yes, you probably wouldn't have come upon it yourself...

Although the uneven quality and compatibility levels in
components, even those used in brand name pc vendors, makes
this aspect a potentially deadly flaw as well. Russian roulette
for some...

||
||| || |
||| || Cars haven't been that significantly different from one another
||| || since the turn of the century. It's a bogus comparison.

||| |
||| |That sentence **truly** demonstrates what a naive little fellow you must
||| |be. Automobiles have been in a constant state of refinement since their
||| |debut to this world. You're no mechanical engineer, that's for sure.
||| Read it in context? Or do you need an ESL class or something...
||
||No, I'm more than articulate enough to deal with your postings. The
||context to which you refer was as moronic as the statement itself.

I said READ not WRITE.

||
||| |
||| || rant rant rant... got to pc group and quit trolling...
||| |
||| |Is this supposed to be a coherent sentence? I rather think not. I'd
||| |ignore it just the same if it were.
||| Your actions state otherwise.
||
||I ignored the suggestion, but I felt compelled to comment on the
||grammatical quality; that's where my actions were.

<yawn|

||
||| |
||| |
||| || Baaad analogy...
||| |
||| |No, I believe you're simply too ignorant to understand what the analogy
||| |was really about. The simplistic attitudes of the PEOPLE (consumers) is
||| |what is analogous. The different products (cars, computers) are not
||| |analogous. I suppose you had to be told since you obviously couldn't
||| |figure it out for yourself. There. You've been enlightened.
||| Well then, PEOPLE were never the crux of this thread.
||| You have tried to veer us off in that direction but, for the
||| most part, it is primarily your own delusion. My comment
||| fit into the context appropriately. Learn to read.
|||
||
||Excuse me, but personal computers (not the world, mind you) are a
||consumer commodity, and that involves at least TWO entities: the
||CONSUMER and the COMMODITY. I'm sorry that you are incapable of
||understanding that fact, and misconstrue it as some "attempt to veer us
||off"...HA HA HA!! I can only laugh at the accusation. Apparently
||your scores in critical thinking are about as low as your reading
||comprehension.

I don't view the consumer as relevant in this discussion.
They have shown themselves to be generally subject to
manipulation to the extent that they resemble finite
state automata.

||
||
|| |
||| || Your naivete is amazing. Do you live in the real world?
||| || MS-dos is a perfect counter example. Success through name
||| || recognition and intertia...
||| |
||
||| BULLSHIT! They just outlasted nearly every other competitor.
||| The superior competition were belittled as toys and game machines
||| until they ran into the ground and the pc-at clones became the toys
||| and game machines.
||
||Fine with me - I like playing great games when I have the time, which is
||why I bought my Atari 10 years ago. Poor marketing strategy (piss poor)
||also had something to do with the running into the ground. Everyone
||knows it. Competition is fierce, n'est pas?
||
||
||
||| It requires a P5-90 with 16Megs running NT to get the same
||| responsiveness as an 8Mhz ST running GEM.
||
||Let me DISPROVE your statement by showing you the Gemulator running on a
||486/80 and have things "respond" faster than on an actual ST - all in
||software emulation. Then quit emulation and show you how much faster
||the windows redraw on the desktop when the Pee Cee is running in
||"native." THANK GOD WE HAVE PROGRAMMERS LIKE DAREK MIHOCKA
(too bad he doesn't have a better personality... '-|)

My 486DX4/100 and P5/60 say otherwise.

And if a PC is running GEM faster, it is a tribute to
Digital Research, not Intel or MS.

GEM isn't an IO bound OS.

This probably accounts for the better Calamus performance on
Atari's vs. NT.

100ns < 8ms

||and we're not dependent upon people like you who are (1) prejudiced (2)
||misinformed (3) full of double standards (4) a highly-opinionated
||know-it-all on a fringe.

You are a fool. You try to put PC's on a pedestal using it's
weakest features.

That is why I'm on the opposite side of the argument for a change.
Atari Cheerleaders are bad but, you're really pathetic.

: okay. Anyone have an idea as to the problem. Anyone have a similar
: setup that works.

Dear Alyre: I just went thru the same thing, combining a remote drive and an internal drive to both register. What is happening, is that since you use Atari Boot Software (AHDI.PRG) and SHDRIVER.SYS each device MUST be mechanically set to a different device number. In my case, an older ASTRA Hard Drive had 6 pins, (2 rows of 3) near the point where the ribbon cable hooks onto the SCSI defice. You need to experiment, usind a drive check software. If you have access to ICD utilities, there is a HDCHECK.PRG contained in these utilities.

What I had to do was change my remote device ID to 1, since Atari treats the MegaSTE drive as device 0. The laser printer is device 7, but won't register with your remote hard drive plugged into the laser interface box until you have properly identified the drives attached.

After I put a clip on the first set of pins on the remote drive, it then identified as drive 1 and solved all my problems. You can do most of this testing while your drive is open, but be careful. When you open your drive, be sure to look at other wires connections so you don't pull something apart.

From: VanMil@mindlink.bc.ca
Message-ID: <79265-813891358@mindlink.bc.ca>
Source record: 157490

Regarding the people that have problems with getting STiK to work, or actually getting HTML to work because like me STiK seems to work just fine.

It is the what comes after is not working fine, I have found out that I indeed have a Provider that does have CSLIP which is the compressed SLIP and they say that that is the way it is and that this can not be changed for my account.

So I am waiting for an update of HTML or SKiP to run CSLIP or PPP before I can enjoy the pleasures of the WEB in it'd graphical form, or does anyone have any sugestions?

The problem that I have after running STik and HTML is that the message comes up >> 0 Bytes transfered << and then it times out.

BVM.

Anyone who turns on a PC and does or does not do his work is qualified to
comment on the performance of the system. Sorry, your high opinion and
self-proclaimed expertise qualify you no more than a novice who has just
had his first Windows session. Both people may have different
experiences and both are entitled to comment. Sorry to blow your ego
like that.

> Only if you're a member of the billyboy fan club...

You see things from such a childish perspective. You must be jealous of
his $9 billion.

> You were the one who sang the praises of running those CGA
> games...

No, I run statistics and physics programs - that's pretty much all the
old software I have to run. Handy that it works. Incredible that you
call yourself a systems programmer when all you can think of is games.

> I am not aware of any Atari based OS that requires 6 megs

Wake up. Even the PowerMacs come with enormous quantities of RAM. RAM
is cheap. This is no excuse; I'll agree with you 100% that PC RAM

managing is a mess, but get off the contention that RAM is that precious
or that you only need 4 megs. 16-bit 44.1Khz stereo digitizing makes
short work of even large quantites of RAM, as does multitasking. More
and more RAM has been the trend since microcomputers had memory measured
in BYTES - so it shouldn't be so surprising to you.

> ||14MB, and at a high cost for proprietary SIMMS. Now there's a formidable

Last I heard, the Falcon was still running a 16-Mhz motherboard. Has
that changed? I suppose you mean someone has figured a way to shoehorn
standard (uh, I mean PC) SIMMS in there? About time, eh? Too bad it
couldn't have been that way from the beginning.

> manipulation to the extent that they resemble finite
> state automata.

Wake up. It's a free market. Consumers make their own decisions. You
don't view them as relevant because you (out on your fringe) are in
disagreement with most consumers. The only way you can defend your ego
is to purport them to all be disillusioned and you to be correct....yeah,
right!

>
> You are a fool. You try to put PC's on a pedestal using it's
> weakest features.

Once again, for the 100th time, I will restate my position for your
clarification. I put ***NO*** computer on a pedestal. I view a computer
much as I do any device or appliance: Its purpose is to serve my needs.
If it serves my needs for a relatively low price, then I find it
acceptably. No device or appliance is ideal. The PC has weak features,
it is a flawed product, as are most products. I use its strongest
features (ubiquity, value, software, compatibility) to form my opinion.
Only a complete buffoon could misconstrue this to say that I "put it on a
pedestal using it's weakest features." Evidently, you are just that buffoon.

>
> That is why I'm on the opposite side of the argument for a change.
> Atari Cheerleaders are bad but, you're really pathetic.

I site your misconstruction of my stance and ego-manical attitude as evidence for my conclusion that YOU are pathetic.

I understand fully that people like Ataris, and I like my Atari. However, (one more time for your edification) I hate to see people spout mistruths and flames about one platform under the premise that another is the Holy Grail. All I seek is the truth. Ataris serve some people well. PeeCees serve a whole lot more people well. There are going to be people who dislike either or both. That doesn't render either the status of "IT SUCKS."

It does work on a Falcon when you patch it using MGX3FCR4.LZH, not everything
works (less screen modes) but good enough to enjoy it!

I use it now for a few months without any problems, but i must say that
i don't ask such high quality's as others. Monochrome is for me good
enough (and fast using blowup, 880x512x2).

And... It's so fast... :-)))

Can STIK handle PP session or not ? My Internet provider only supports PPP, and as far as i have been told SLIP is a rather old way of communicating.

Right now i got STIK working as far as logging on, but when i load CAB then nothing happens. Is this because my Internet provider only supports PPP, or have i done a mistake ?

Windows DOES crash *very* *very* often and is a crap product. I am not going to insult you intelligence by saying that you "most likely do not know what you are doing" but it is a fact that Windows is not an OS and cannot even approach one. It cannot handle rouge programs in any but a very basic and flawed way which often fails. Compare this with Linux - on the few occasions that a program has crashed when I have been using Linux, it has never affected the system integrity - I just swap to another virtual terminal, kill the old process and swap back to the previous terminal. This was when running Linux on a PC - so it does not have anything to do with hardware.

If you get a GPF in Windows then you normally have to quit and restart it because otherwise it starts to crash everything else. Windows often stops responding to the user if a program goes wrong, it sometimes won't let you kill this rogue program because you can only do that if "there is an application that is not responding to the system. However there is no program in that state". This still happens with programs costing thousands of pounds.

OTOH my Atari crashes even more often - but it does not have the hardware to stop this from happening - you must have an '030 for that.

you've got it fitted.

Hi Shaun,
Sorry for the delay of my answer, but I've been somewhat busy...
I've ordered it from Tom Thomason at Falcon Pro Center in Gothenburg, Sweden
and he gets it from Wiztronics. It will get delivered in October-95, so I guess
that it's pretty soon...
I don't remember Tom's e-mail address, but he probably reads this letter too
and can maybe give you some more information. TOM! Are you there?
When I've got it inserted and have been able to test it I'll post some kind of
note here about the results (if noone else gets there first). I work mainly
with Cubase Audio and if the Hawk works with it, I'd say that it really is 100%
compatible - like they claim - because Cubase Audio is the most sensitive piece
of software you can run on a Falcon.

Best regards,

Claes

About one month ago, Jan-Olof Granlund posted a software announcement for the JDEB High Level(Source) debugger for Lattice C. When trying to obtain the file from ftp. uni-regensburg.de, the file jdeb_ok.lzh still shows up as being in the incoming directory and does not allow downloading.

Has anyone downloaded the debugger? If so from where? What is the debugger like to use? Any help would be greatly appreciated as could really use a source level debugger for Lattice C 5.6. Thanks.

From: Paul@pwomar.demon.co.uk
Message-ID: <813884764_OASIS_@pwomar.demon.co.uk>
Source record: 157603

I'm getting totally fed up of the constant quoting of massive lums of irrelavant quotes of quotes of quotes etc Anyway I'm just posting from memory so sorry if I mis-quote anyone I apologise.

1, People are talking about my PC has 8meg of wotsit ram 50meg of thingy ram and 400 gigabytes of secondary cache.
So what? What can it do that an 8meg TT or 14meg Falcon can do? Not a hell of a lot. I have a 4 Meg STe and the fact that I can multitask with a pre-emptive stable and fast multitasking system with loads of programs running fairly reliably and speedily is something that most PC owners could not even contemplate. The same thing applies with hard drives, so what if you can get 10 meg a second from a 5gig SCSI drive, I have a 170meg drive that runs at about 1.4meg/sec and most of my programs load up in under 2 seconds and virtually never take up more than 500k of space.

2, Even with the incredible processing power of a fast pentium I have not yet seen ANYTHING that comes close to the incredible speed and ease of use of Tempus 2 running on my 8mhz ST. That is quality coding, due to the 80x86 series' bad design programs like that that use the full potential of a chip simply do not exist.

3, For my ST to do anything useful I don't need a chip that uses up about as much electricity as an electric fire and my motorola doesn't have a fan on it and it won't even make enough heat to warm a flea turd. For example, one of the flagship products for the Atari is That's Write 3 and a simiar word processor for the PC would be something like Ami Pro or works, now I have only used works. Thats write 3 does everything that the works wordprocessor can, with speedo fonts, auto checking and correction and a pretty fair turn of speed compared to a low end 486 whose raw processing power easily outstrips the St many times over.

4, If you want a PC then get one, I don't really care but people continually buy machines that they do not need and that are not suited to them just because everyone else has them. Many people just wanting to do a spreadsheet and a bit of word processing and email will automatically think they need a pentium with 16 meg of ram etc etc when they could easily get by on a low end atari or amiga.

4, One poster congratulated that autours of Doom and proclaimed that although a previous poster had pointed out many shortfalls of the chip this sort of game was still possible. Possible? yes, Normal? NO. If the chip was better designed there would be far more good games like Domm. It is incredibly sad that you need huge budgets and massive teams of incredibly talented programers before you can harness the machines flawed potential, Id is a good exception to the rule. If the chip was made well and easy to use and the PC had some sort of decent built in hardware then things migh be better but if you use a chip based on technology from 2 decades back and absolutely no propper route for expansion except through

chip interrupts. Sure you can get a card for this, a card for that but if you have a good number of standard chips that you can guaruntee will be the same in every machine you can harness potential. Otherwise you have to rely on am inefficient chip to do all the hard work.

5, One issue raied was that of backwards compatability. It was said that if you try to use the old games being sold on a modern machine they will almost all fail (eg Falcon) but on a PC almost everything will still work, this is of course true BUT which would you prefer:

Spending hundreds of pounds on a new piece of software only to find that it crawls along because the chip you are using cannot access it's full potential to regain compatibilty with some old game you might pick up for a few quid at a car boot sale.
OR
Spending 80 or so pounds on a new piece of software to find it zooms along like like a hare on speed, because it was designed with your chip in mind and your chip design was made on it's own merit and not to vainly grab onto the past.

I know which I would prefer, the reasons for the incompatabilty with Falcon and the ST is that because of the newer faster chip, newer faster graphics, sound and processing chips are used and the jump was from a 68000 to a 68030 rather than in small increments.

Anyway my ST does what I need it to do for the moment, I like it and it doesn't have much power but what it does with it is incredibly impressive. Fed up of typing now so maybee if i think of something I'll write again...

701. Re:Atari...Pride?(The appology)

Newsgroup: comp.sys.atari.st
Date: 1995-10-16 00:00:00 UTC
From: Eric Noss <enoss@planetx.bloomu.edu>
Message-ID: <Pine.SUN.3.91.951016150736.2211A-100000@planetx.bloomu.edu>
Source record: 157604

I have been following up on the Atari...Pride? posting and I was deeply distrubed by the stuff I was reading. I tried to state my orginal intent about the lack of support from Atari and having to move on to the clones. How cars and sucking came about I don't know. I was questioning the "pride" of Atari Corp when I seen this statement made by a receptionist which was in a posting:

>"Atari Corporation prides itself on no longer supporting its computer
>lines."

To which I said:

>Gee, I didn't think Atari Corp had any pride left. Especially
>blowing a great machine like the Jag down the commode.

Ever since I first read about the Jag in Jeff Minter's readme file, I thought that this is going to be Atari's shining hour. This was perhaps their last chance of redemption in the eyes of others. They can have their reputation restored. But you all know what happened...

I was naive to think that even Atari won't blow this one. Well they did and that ticked me off. I'm not usually an Atari basher and I try to support them, but after cutting off the ST only to foul up the Jaguar's place in the game market...well sir I don't like it one bit.

Then I was making a point about me having to get a PC because Atari has no support and I need something for the future; and being a shame if I have to choose PC games over Jag games for the same reason(The other game systems just don't thrill me).

What I wanted to do was to turn a PC clone into an Atari machine that is as dependible as the XE and ST I used. But someone said something about giving up a Motorola for an Intel and I responded:

>You are right about the Intel compared to the Motorola. The 68K is
>superior in most ways. I'm taking an assembler class for the x86 and
>even my teacher says the same thing. I would rather learn how to
>develop for a 68K machine mainly the ST.

I was speaking for myself from a programmer's view point. What I ment was the the 68K has certain advantages over the x86, but the same is true for the vice-versa. Since I wanted to be a game developer and most systems use a 68K, I figured it would be a good bet to program for this machine. But I also would like to try my hand on a PC machine as well because let us face it, it is the king of the roosters in the computer world.

I'm sorry with this was taken as PC bashing, but I personally prefer Atari because I know from experence that their computers are reliable and there is a strong support group from the users. I figured that if YOU like Atari computers but HAVE to use a PC for some reason, at least you try to make your Pentium into the ST that you are comfortable with. I believe that Atari users should help each other "cope" with using a PC that is "foreign" compare to the ST.

What makes me made is the fact that certain PC companies use underhanded tatctics do be virutally screw the consumer; but that's a different topic.

But this has nothing to do with my orginal point which was "How Atari can treat their customers like they". I suppose there will be responses to any of the points I made and there will be flaming. But please remember this...I love using Atari computers but it's not like I made it my religion!

I'm sorry for those who had to read all the drivel from this topic, believe me it was no fun for myself. And if anybody disagrees with any of the points I made, at least have some proof and some sign of intelligence. Please...

Eric Noss

For PPP, just set the local IP address to 0.0.0.0 in the startup.nos file. You might get an error message saying something like 'unknown host', but then the address is negotiated between NOS and your server during the connection process. It works fine here, so it shouldn't be a problem.

No, that's not true. The boot drive may be a BGM drive. This is true for at least all AHDI compatible drivers.
I simply don't understand why there is so much wrong information about this topic. Restrictions concerning drives working with Atari machines and partitions sizes are much less severe than most people are trying to make us think in this group.

Source record: 157613

I have a couple of disks of Notator songs which when I try to load into Notator give me an error message along the lines "Song Conflict".

The problem stems from the fact I tried to fix the floppies the songs were on using the Norton Utilities program on my PC at work.

I first experienced
reading errors on the disks after using them on my Mega ST2. I normally use a 2meg 1040STE. (I recall reading that TOS 1.02 has a media change bug, I'm assuming this is what corrupted the disks).

So, Nortons certainly got the disk working, restored file names on some songs and converted other songs to filenames like filennnnnn.dd, but I cant load any of them without experiencing the error message in Notator.

Can anyone help?

I dont have ready access to this group so any replies would be much appreciated at

Peter.Hopson@forestry.tas.gov.au

713. FOR SALE: COMPUTER - ATARI 1040STf + extras

Newsgroup: comp.sys.atari.st
Date: 1995-10-17 00:00:00 UTC
From: Andrew Thackrah <at>
Message-ID: <46030i$kie@scotsman.ed.ac.uk>
Source record: 157616
Cross-posted to: ed.general,eduni.general,comp.sys.atari.st

I'm selling the following bits & pieces:

Atari 1040STf computer (+ mouse)
Atari SM124 mono hi-res monitor
Atari SF354 external single-sided 3.5" disk drive

all in good working condition.

Sorry, but no BASIC/sys discs, user guide or packaging included, but
I can sort out one or two essentials if needed.

Asking price: 100 pounds for the lot (but will consider split deals)

Contact Andrew Thackrah. at@roe.ac.uk Edinburgh, Scotland

714. Aggressive 2 Party Intro for Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-10-17 00:00:00 UTC
From: krlawson@xgw5.pal.xgw.fi
Message-ID: <4606gs$rs3@news.xgw.fi>
Source record: 157617

The Aggressive Party 2 invitation intro has now been released. The intro
requires an Atari Falcon 030 with 4 Mb ram. The intro contains a very nice
rotator zoomer with 24bit motion blur. After the short demonstration
a text viewer will show some essential information on the party.

The package also contains a similar text in ASCII format. The file can be
obtained from ftp.funet.fi and ftp.uni-kl.de or by sending email to me
or by looking out for some member of Aggression on #atari, IRC. The file
is named aggroinv.lzh and on funet it is in the directory
pub/atari/falcon/demos. On uni-kl it is in the directory
pub/atari/falcon/gfxdemos. If you just want the invitation text file
send email to me and I will forward it back to you.

The intro has been created by AGGRESSION.

CyberVCR was marketed by Antic magazine's software division as part of the Cyber Studio line-up. The device is actually quite simple and could be duplicated easily. If anyone's interested, I could make up a circuit diagram of the device (one transistor, a resistor, cable, and maybe some other parts).

How difficult is this to find? Well, good luck. It had a fairly limited market (CAD3D2 users who also owned the particular Sony VCRs it ran).

I suspect one could write some decent software if you have knowledge of Sony's Control-L format and RS232 programming. There's a shareware EDL program that comes with diagrams for building a Control-L port for two sony decks. Only runs on a pc, though.

> are buying old ST's? :)

One resource that might be of use to such folks is the starter.tos and
starter.readme files on atari.archive.umich.edu. This is a self-extracting
archive containing several decompression utilities, and should help to
solve the "chicken and egg" problem with respect to downloading ST software.
Here is the readme:

--begin included hunk--

This file is a self extracting archive that will, when executed, create
the directory STARTER and extract the following files within:

STARTER/ARC602/ARC.TTP
STARTER/ZOO/ZOO214.TTP
STARTER/LHARC301/LHARCENG.TTP
STARTER/ESSCD506/ESSCODE.PRG
STARTER/ESSCD506/ESSCODE.RSC
STARTER/STZIP_25/ZIPJR.TTP
STARTER/COMPRESS/COMPRESS.TTP
STARTER/COMPRESS/COMPRESS.TXT
STARTER/README.1ST

This will give you the ability to handle .lzh, .arc, .zip, .Z, and uuencoded
files. One should get the latest (and complete) versions of these utilities
from the /Archivers directory as soon as possible.

--end included hunk--

Out of the ether, the following was mentioned by maberg@xs4all.nl...:

m> No, but admittedly, it does hurt a little to see an otherwise great
m> system go `down the drain' because the majority of users choose for an
m> inferior system, thereby creating such a massive monopoly for both
m> iNTEL and M$ that all competition dies a painful death.
m> It's all bloody marketing, that's what it is.
It was all IBM's fault! If they hadn't of used their might to force an
inferior machine down most businesses throats we wouldn't be in the
predicament we are in today!

m> processors (1988 ?). The list goes on and on. I know this is ancient
m> history, but it shows how a very progressive and advanced system is
m> killed by true mediocrity. Or do you know of *ANY* innovation in the
And lack of marketing/advertising!!!

m> computerworld that was actually invented by iNTEL or M$? I cannot
m> think of _anything_, really.
Hmmm, well how about the first true multipurpose CPU (the 4004 I think) the
guys who started Intel used to work for a calculator manufacturer (TI?) and
wanted to see something more useful being developed.

Now on the MS front i'm not so sure that they have invented anything just
take/plagarise other peoples ideas, "improve" and then market them. Lets face
it the only truly great thing MS do is marketing (I apologise to the MS
programmers!!!)

m> of a Pentium hides all the drawbacks and deficiencies from people that
m> don't take a closer look and only go for the glamourous presentation
m> and the b*llsh*it they're told by most computerstore's staff.
Most computer store staff don't know really what they are selling apart from
the amount of commission each product carries!

m> Why don't you leave people alone if they're happy with their
m> respective automobiles/computers ? Isn't that a *true* sign of
m> insecurity ? I'm not trying to convince you to buy an Atari, I'm just
m> saying it suits me fine. Why do you keep on about us needing a new,
m> `better'(?) computer then ?
He's beginning to sound like another Sinclair clone.

: >it gives over 2600. Another ones of my SCSI drives gives about 1450k/s -
: >so I'd guess this is a limitation of the bus and not the drives. Its
: worth
: >noting though that in both cases the drives are SCSI2 (as is the
: AHA1540B
: >card in the PC) wheras the TT's bus is SCSI1.

I measured 1800..1900 kB/s on TT (HowFast-test) using HP's 1.05 GB SCSI-2 drive. That seems to be about as fast as it gets on a TT..

The driver was HDdriver 3.x with no caching.

: That seems to be in the same ballpark as the Falcon. I have a
: Quantum 540LPS and Ratehead runs about 1500k/s, my Segate Hawk
: comes in at about 1440k/s. The same results are found with HowFast.
: By changing the block size in HowFast,it looks like it would help you
: set up your HD caching as you see a graphical line representing
: both continuning and burst rate transfer. On my DX2/66, the ISA bus
: using an Adaptdec SCSI controller was slightly faster. I connected
: a Conner 250mb 3.5" to the Falcon IDE and saw an improvement over the
: standard 80meg ~900k/s vs ~1300k/s. TOS measurements made with AHDI 6.06,
: HD Driver 3.xx and the ICD pro driver with none showing any speed
: benifit.

My Falcon connected to 540 MB Seagate ST5660 IDE-drive gives How Fast transfer rates of 2700..2800 MB/s, using HDdriver with no (!) caching. The "multiple read/write" -feature was switched on. By the way, on Falcon at least, the driver used seems to affect the IDE results considerably. When I tried HUSHI 6.10 multiple r/w switched on, the results fell about 200 kB/s..!

Someone here mentioned that his Falcon gave 3300 kB/s with Seagate Decathlon 850 (How Fast).

So, not bad at all, I think... Using read/write caches, and perhaps higher bus speed, pretty nice data transfer rates can be achieved on Falcon.

: The same 250m/b Conner connected to my new VLB card in the PC with
: special driver runs ~4000k/b! Go figure. Now lets see, I think I can

: mount that VLB card in the Falcon case if I yank the powersupply..:)

PC's SmartDrive uses (IIRC) read/write-cache all the time - and as most PC-users probably use some kind of a caching program, many results from PCs seem to me unnaturally good.. Don't know about this 4000 kB/s, though. New IDE-controllers should be fast..

: Mike

I like to know if someone has managed to get a connection with a provider
who uses a dynamic IP address using this NOS/Oasis program.
I'm very curious how you handled it. 'Cause I don't get it :'(
I'm using an STf, 4Mb, Tos 2.06. provider with Slip/PPP/etc.

Anyone?

Bye

I am using SLIP and recently switched to a dyanamic IP because it was much
cheaper for me. I did it about 7 hours ago so my methods may not be totally
bulletproof but have enabled me to use NNTP, Telnet and SMTP. I am not sure
about POP3, which I really need, but should know in a day or so.

In the STARTUP.NOS "ip address []" maybe [0.0.0.0.] would also work?

When NOS starts up it complains abit about the IP but once I get my assigned
IP, I type into NOS "ifconfig sl0 ipaddress <IP>"
I then type from the NOS> "ip address <IP>"

It does not work for me if I use only one of the above commands, only both.
and I am not sure how well it works but I get a session going as I mentioned
above. Now to see if I can post this......Rob

Umm.. yes I got this and the .TOS unpacked itself
OK.

It unpacks to over a megabyte. Are you trying to unpack onto a floppy -that
may be the problem. The archive should be 312268
bytes.

OR, maybe you have a bad block on the
floppy.

If it's an LZH archive you need LHARC310 - should be available almost
anywhere.

Many ST ppl recommend Ultimate Virus Killer for their computers as the
best virus protection. You can get this at Toad for only $29.95. There
are other protectors on PD, but this is the only one so far to detect the
Beilstein virus. I hope this helps...

Source record: 157515

kdamir@fly.cc.fer.hr (Damir Kaknjo) spake thusly:
DK> Subject: Spectrum ZX
DK> emulator for Atari I had one ZX Spectrum 48 K 6 years ago.
DK> Now I am very nolstagic, also I have the great library of
DK> spectrum games and programs. I would like to run them on my
DK> Atari 1040 ST. Is there any spectrum emulator for Atari?
DK> Thanks.

I have played with a zx81 emulator that I got off of our bbs here.
Unfortunately, it is no longer there, and I deleted it after a
while. Sure took me back though. It was German, I believe, and it
worked fine on my 1040STf. I don't know about compatibility issues
between the spectrum and the zx81. Are they the same?
I think that I could locate a copy, since we put it on a club disk a
while back. Let me know - I have been wanting to try out esscode.

749. The CyberDen is now FREE

Newsgroup: comp.sys.atari.st
Date: 1995-10-18 00:00:00 UTC
From: bat@cyberden.com
Message-ID: <882044894.4599157@cyberden.com>
Source record: 157638

The music underground is alive and well and is now FREE!

Log In and become part of a community of musicians and artists, plus get free Internet E-Mail, News, gigs of files, fonts, images, sounds and participate in an online community... ALL FOR FREE.

o The CyberDen is now a completely FREE site. No subscriptions required.

I've become officially unstable. It's time to pull out all the stops and proclaim palandrifically, "WOW BOB WOW" while standing on my head as my ears are turning red.

This means everything on The CyberDen is free. No subscriptions are required anymore to access all the neeto stuff ok?

o Only catch are the "Mature Areas" sections

If you are accessing an area and get a 1030 error, that means you're not allowed in there because it's an area we restrict to those who send in the completed "Mature Areas" form found in these mature areas. Simply download, fill out and send in with a xerox of your drivers license/passport proving you're old enough to go to jail on yer own and yer in!

o What's now free that wasn't?

- Internet E-Mail and News (Usenet)
- OneNet E-Mail and News
- The Internet Mailing List area
- The Internet Zines area
- The Carrousel area
o The Black Pages (Like the Yello pages but for the scene)
o Vomit Lunch (The most vomitacious images around)
o Press Releases (What's new, What's out there)
o The Listening Room (Download ENTIRE SONGS)
o The Culture Areas (images...sounds...texts)
. Industrial
. Gothic
. Ambient
. Alternative
- THE ENTIRE FILE AREA!!!!!!!
o GIGS of software! Mac, IBM, Atari-ST
o CD-ROM Access! Includes over 1500 fonts!
o MIDI/MUSIC/SAMPLERS/SYNTH patches, sounds, editors and more!
o FileNetted Mac/IBM areas!
o Images center! Graphics galore for your own perusal.

o How do I get an account?

Same as before. Call up or log in over the Internet. See our web site for full instructions at http://www.cyberden.com/

When you log in, REMEMBER! Your internet email account is made up of your First Name, Middle Initial and Last Name that you fill out when logging in. Your UserID is NOT YOUR EMAIL ACCOUNT! - Therefore, if you want a cool, simple handle for your email account name, enter it in the LAST NAME field only. Leave the First Name and Middle Initial fields BLANK!

You must call at least once every 14 days or your account gets deleted!

You can dial us direct with your modem at 510-633-9811 or if you can run NetScape, you can tell FirstClass to log in over the internet as well. Just choose for the first setup MODEM connection, put our IP# (204.182.11.180) in the 'server' box and choose tcp/ip for the second setup screen. Make sure in the advanced setup area in the second setup screen that you up the tcp/ip buffers from 10000 to 32767.

o How are you keeping this site going?

I knew you were going to ask me that. DONATIONS AND ADVERTISING! Since we're free now, we're getting tons of traffic on the FirstClass BBS. Our WEB site is getting over 125,000 hits per month and is growing in hits each day. If you want to advertise your band, label, clothing store, multimedia project, coffee house, etc. - then call us! Our rates are inexpensive. VERY inexpensive. I mean el cheapo.

If you're feeling like a sugar daddy then we're more then happy to fulfill your fantasy and accept all donations. We need $$$ to keep the phone lines humming and the hard drives spinning.

You can send all checks, money orders, wads of hundreds and gold bullion to The CyberDen at: PO Box 150465, San Rafael CA 94915

If you would like to advertise on both the BBS/WEB site hitting literally thousands of people a day, call us at 510-636-9525 for rates or a rate card.

o What if I'm a label and want to do more then just advertise?

If you wish to get your own CyberLink area where you can have your new releases be it record releases, software releases, twinkie filling releases or hairball removing cream releases, call us too and we'll go over our rates for CyberLink areas. Please check out the WEB site and CyberLink in the BBS to see exactly what we're talking about. Words mean nothing sometimes and pictures mean everything.

o What if I already just subscribed or am a current subscriber?

Then you're cool and godlike in my world. Your donation(s) will go down in my heart forever as kindness from a soul of purity. And if you're still miffed, write me. I have some CD's you may dig.

o Can we be geeks and hangout and chat till we puke?

Yes... fine... of course... and don't be surprised if you find Chemlab, Xorcist, Insight 23, Cleopatra, Fifth Colvmn, 16 Volt, COP International,

21st Circuitry, Switchblade Symphony or any other random label or artist hanging out there chatting either.

We're also in the works of having another chat fest with cEVIN kEY sometime soon... really... honestly... Hey, we did Young Gods and that was a blast...

o Can you summarize what you just said?

It's FREE! All FREE! FREE FREE FREE FREE FREE! GEEK OUT! FREE FREE FREE!

and for those company types:

ADVERTISE! IT'S INEXPENSIVE! CALL NOW! 510-636-9525 FOR RATES!

and for those lottery winners:

FEEL GOOD ABOUT YOURSELF! SUPPORT THE SCENE! BECOME ADMIRED BY EVERYONE! DROP A WAD TO THE CYBERDEN AND GET ONE ROW CLOSER TO THE FRONT IN HEAVEN

= = = =

750. Wanted: Guitar tablature software

Newsgroup: comp.sys.atari.st

Maybe it's just because for a non-programmer it's hard to see which
part of the operating system causes a limitation: The hard disk driver,
BIOS, GEMDOS, the partitioning software or whatever. Apart from that,
most people use their partitioning software only once or twice, so
they tend to forget the details.

I partitioned my 520 MB Seagate IDE-drive by accident as a 500 MB drive (one jumper at wrong place..). So, I got about 20MB less than what the drive could actually deliver. Big deal.. Anyway, I tried to change the partitioning afterwards with ICD Pro tools (oldish). I tried to re-build the last partition to be longer than it used to be, and thus use the unused space.

It seems this wasn't a good idea, as I suspected... =-(The drive was originally partitioned with HDdriver 3 software (which doesn't give me a chance to set the last sector of the partition manually). Apparently, ICD Pro, though recognized this partitioning correctly, and set in AHDI-compatible mode, isn't compatible with HDdriver/SCSItools-method of partitioning. My last partition disappeared completely, after ICDformat announced it had succesfully re-built this partition (larger than it used to be).

Well, this didn't cause me any serious trouble - but can anyone tell me, what I _should_ have done to change my drive from 500 to 520 MB..?
Can it be done at all, afterwards? Is "re-build partition" only capable of keeping the partition's size the same it was when originally partitioned? It's clear to me that this trick couldn't be done with any other, but perhaps the last partition of the drive. Or can it be done with that, either?

Thanks for advice,
TH

I am amused that you think the PC is provides this euphoric computing experience for the "CONSUMER". Call me crazy, but when I buy a machine with SIXTEEN MEGABYTES of RAM, I expect to have it at my disposal whenever I want it. However, for some reason I find that I only have 640K in DOS. But wait.. didn't
I buy the extra RAM? Yes, it's definitely installed in the machine.
OH!! Silly me. Microsoft's "innovative programers" have provided the system with an artifical 640K ceiling. Dumb.

And know what? No matter what Microsoft says about Win95, the segmented 640K architecture is still alive and well in Windows 95. That means that, here in 1995, even though we have a BRAND-NEW, IT-WILL-BLOW-YOUR-MIND, START-ME-UP, OS, the system is still limping around dealing with 64K segments.

This is VERY primitive when you consider the forward progress that computers such as the Macintosh are making. The WONDERFUL CONSUMER MACHINE (PC) that you tout is just now getting poorly implemented versions of capabilities that are old news on the Macintosh. Why so long? Well, the programmers have been spending %50 of their time and effort combating the idiotic system architecture.

What? You don't believe this? Consider the fact that Apple continues to lead the advance in personal computer technology with development teams that are a fraction of the size of Microsoft's. This is possbile largely because they made very intelligent decisions when they designed their computer hardware. The first of these was to use the MOTOROLA 68000.

Did I mention that you can use as much RAM as you have installed on ALL of the 68000-based computers? And at any time. Imagine that.

> - I have no interest. I'm sure you have a pocket protector you ordered
> from the magazine.

Did you know that the embedded systems programmer must perfectly understand the fundamentals of the computer he programs. There is no DOS or Windows. You either MAKE your OWN OS, or you CUSTOMIZE a commercially-available REAL-TIME OS. This is not a task for a junior programmer who has "written a few lines of C."

That your microwave or your Mustang work is a credit their respective embedded systems programmers. Embedded systems must work under a wide range of conditions and, in many cases, MUST NOT FAIL. The next time you're hooked up to a respirator and it's breathing FOR you, it probably would not comfort you to think that the programmer MAKING YOU BREATH is some programmer straight out of community college. Companies don't think so either, and that's why embedded systems programmers enjoy good, well-paying jobs -- a company can NOT afford to have it's system fail (and open itself up to a lawsuit) because the embedded sytems programmer didn't understand the hardware.

> > I would say that most computer shoppers don't know what the heck a

Don't care about embedded systems, eh? I bet you'd care of them if you ever get a modern PACEMAKER. It would be unfortunate if that ever failed.

Or would it?

767. TOS upgrade on an STe ....aaaarrrgggh!!

Newsgroup: comp.sys.atari.st
Date: 1995-10-19 00:00:00 UTC
From: zrollinso@cuppa.curtin.edu.au
Message-ID: <465736$h0t@info.curtin.edu.au>
Source record: 157520

I just got my TOS 2.06 upgrade for my 520 STe only to find that the upgrade doesn't work on my motherboard.

The Supplied ROMs are marked

TOS 2.6 EO
MYF UK U207

and

TOS 2.6 EE
MYF UK U206

When the Atari tries to boot I get a black box in the top left of the screen then three bombs appear and the reboot sequence starts again.

This, so I have been told, indicates that the chips are in the right way around but will not work with my motherboard - great!

Now, it seems that there is an adapter available from Analogic Computing in the UK which enables these roms to work and also allows switching between the new and old roms.

Does anybody know about this?

Apparently the board mounts into the original rom sockets.

If this is true, it must be possible to mount header sockets into the original sockets and remove or join legs or something to achieve the same affect.

Can anybody help?

Thanks

Steven Rollinson

TOS ROMS

ATARI STE (Tos 1.6, 1.62, 2.06)
These have 32 pin I/C holders.

My 1.6 and 2.06 tos versions were both the same type (32 pin type 27C010A)
Here follows the jumper settings for other ROM/EPROM types:
From the STE Computer Field Service Manual (C302481-001 REV A Aug 91)

ROM Jumper settings:

ROM/EPROM Part type W102 W103 W104
27256 Don't care 1 and 2 N/C

27512 2 and 3 2 and 3 N/C
571001/27C1000/531000 2 and 3 2 and 3 2 and 3 (the default setting)
27010/571000/27C1001 1 and 2 2 and 3 1 and 2

The jumpers are located next to the HI eprom

W104 W103
1-2-3 1-2-3

Source record: 157522

In one of the issues of the German magazin "ST Computer" there will be
a software solution to print from a Mac or PC via serial cable to an
ATARI SLM. But we do not support postscript, basically.

There are two programs for the atari, that can be used to print psotscript
on the laser:

- Composcript - should still be available
- and another one (which name I just have forgotten :-) That one isn't for
sale anymore.

And certainly there is GhostScript.

I'm writing this from memory, but I think you'll find a Harlekin .def file geared up for colour in the harlekin directory if you installed it all. It will need renaming to harlekin.def. I can't remember it's default name, something like harlcolr.def. Rename it, reboot, and I think it will work.

: i can finish my command without any problem with the next keyes. After a CR
: i'm often back to the same problem again. This only seem to be a problem

Well, I don't really have much of a suggestion, but any thing must be
better than nothing.

AIUI, the Modem will use the first character of the AT command to
determine the BPS rate of the computer. This is why you can switch the
computer's rate without notifying the Modem, and it wil still respond to
commands. Now, since your problem stops occuring after the first
character has been typed, it seems to me thaht the Modem is having
trouble detirmining the BPS rate of the computer. Once it figures it out
(after 3 - 4 presses) the rest of course goes fine, as it only checks for
the BPS rate on the first character. This suggests thaht perhaps there is
a problem to do with this part of the modem, or something related.

You might like ot try the Modem on a PC or Mac, and see if the problem
still occurs. If it does, I would return the Modem, and get another one,
as it seems to me that the Modem would most likely be faulty if it
doesn't work on a PC or Mac either.

I'm afraid this probably isn't all that useful, but maybe it will help
you sort out the problem.

Some newsgroup readers may recall that, a couple of weeks ago, I asked people who'd had experience with ST monitor breakdown to send me an E-mail. This "informal survey" was intended to either prove, or disprove the suggestion that ST monos tend to expire more frequently than their coloured counterparts.

The results of this survey are less than scientific, but do cast some light on this contraversial subject. My findings are as follows:

I got many E-mails from people whose monitor hadn't failed (even after I modified my post, asking people not to do so). Literally dozens of people just wanted me to know that their monitor was still working. These may be the same people who want the obituaries to specifically note that they are not yet dead.

Of the reported Atari monitor failures, monos outnumbered colour units by a good margin as show below (please note that the following are direct quotes from the respondants):

Cases of Mono Mortality:
~~~~~~~~~~~~~~~~~~~~~~~
* SM 124 Hozinonal scan goes wrong/ sound internmittent (1)
* SM124 blow up on me once which was 3-4 yrs old. (1)
* 1 mono monitor died due to a burnt out capacitor (smelled up the room like burnt peanut butter!), and was fixed... then it died again of unknown causes... probably the flyback transformer, which apparently has a high mortality rate. (2)
* The model I am using now is SM124 manufactured in March 1989. I obtained it free from a previous user because it was broken. The fault was tricky to find but turned out to be an open-circuit RF choke in the base circuit of the chopper in the switch mode PSU. I have since refurbished two other SM124 of about the same age - they were both working when I got them but exhibited poor brightness and contrast. After cleaning up I replaced just one electrolytic capacitor which had been leaking badly. I reset the PSU output using B ADJ and then lined up other presets (notably SUB BRIGHT). While I was there I increased the picture size modestly and re-adjusted the aspect ratio. Apart from some screen burn which is NOT visible when the monitors are running they work as new. (3)
* I have had (and still have) 6 no-functioning SM124's and one no-go SM125 (7)
* I own a dead mono monitor Atari sm124. (1)
~~~~~~~~~~~~~~~~~~~~~~~

* I have two sm124's, and both have in recent memory required fixes.
One generated the "dead monitor" syndrome right in front of my eyes.
Both of these monitors had had their viewing areas increased by
non-pro's. Each cost about $75 to fix. (I am not that confident of
my troubleshooting and soldering expertise.) (2)
* I bought the first SM124 in 1986, it's life was blown out in 1991,
from year to year it has been increasingly noisy. It's a fine, high
flimmering sound as you can hear when it's wet under those electricity
lines going overland but with a continuous frequency.Then I bought a
new SM124 and have a similar impression of what will happen as it's
increasing his nasty music too. (2)
* My sm1224 just died 3 nights ago.
It's a Goldstar variety built in 1989, served solidly and reliably
until 12 months ago until it developed a 'shimmering' image. It was
still usable though, but I suspect the frequent thumps didn't actually
do that much good. Anybody got a circuit diagram? (1)

Colour Crap-out
~~~~~~~~~~~~~~~
* Thompson 36512AR loses focus after 10 hours of use (1)
* I am using my 3rd SC1224! These units tend to blow up every 1-2 years!
Had one fixed even. Now its cheaper to buy a used one. (4)
* 1 colour monitor has died of unknown causes. (1)
* Do you wish to know that I also own a dead Atari sc1224 color
monitor? (1)
* I also have a sc1224 that has worked perfectly for many years. On
the other hand, our club is in posession of about 6 of them that
died in the school they were being used in. (6)

=> NOTE: Mono mortality = 20 /Colour Crap-out =13

Useful tips and comments offered by six different respondents
(direct quotes):

1) If you manually increase the border size on the mono monitor
(most people do), then an added stress is put on the main power fuse.
This fuse usually is to blame for most 'dead' mono monitors. A two
cent fuse gets it going again. Most people are not that bright.
Offer to 'fix' the broken monos. If you can fix them, charge them $25
for doing so. If something else is wrong, give it back.
manner

****

2) The predominant failure mode in the SM 124 monitors)is the non-
polarized capacitor in the flyback circuit. It is not the
real problem, but its location next to a heatsink is.

All of mine have that nonpolarized electrolic replaced with a
polystyerene or polycarbonate, on long leads stuffed wherever it will go.
An electrolitic will serve, I suppose, if it is far from that heatsink.
~~~~~~~~~~~~~~~

Best Electronics has capacitors, and flyback transformers, which may die
due to a failed capacitor.

I did buy one that was dead due to a failed rectifier diode, which burned
up the power transformer. I re-wound that animal for myself, but would
not do that for anyone else.

AFAIK, the things will last almost forever, if that cap is moved away
****

3) I believe that part of the mono scarcity is caused by this sequence:
1) Increase viewing area, 2) the thing blows up, 3) costs too much
to fix (or so it is thought), 4) into the dumpster with it.
Since the "dead monitor fix" is available to anybody who can find
the file and who can wield a soldering iron, this probably shouldn't
happen. But I'll bet that it does.

****

4) I've had my SM124 since 1985. The only problem I had was shortly after I first
got it. And if I remember correctly, it had more to do with unseated chips in
the ST than the monitor. The image had shifted to the right so that the right-
most column (of an 80-column display) was somewhat narrower and brighter than
normal. A tweak inside the monitor was also performed. Since then, no more
trouble!

****

5) I'm not a hardy man and not very cautious (dust, heat, smoke...) but
stopped recently to switch on/off monitor and other devices with the
same switch together. Maybe this is magic too. At least turning off
with the monitor's own switch avoids the lightning-like flash on the
screen in the moment the image dies.

I heard some rumors that lifetime of monitors can be shortened by some
kind of screensaver(!)-progs but don't know which kind. So I avoid
using any screensaver that works directly with hardware registers or
produces some noice the moment it changes screen.

6) At my college we have MANY ataris, the mono montiros seem to
last longer than the colours. Although sometimes the colour monitor is only
broken due to the lead they definately go before the monos !

****

Conclusions of the Surveyor:
~~~~~~~~~~~~~~~~~~~~~~~~~~~
There are clearly more known cases of monos failing or exhibiting problems
than their coloured counterparts. Unfortunately we don't know the relevant
populations of each monitor type, so we can say that monos have expire
more frequently or have shorter service lives that coloured units (although
I have believe that there are more coloured monitors kicking around than
monos - making the preceding even more significant).
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Based on the information provided, however, I believe that, on average monos don't have the same longevity as ST colour monitors. If I were buying a used unit I'd be more inclined to ask the owner about the extent of its previous use, whereas I might be comfortable buying a used colour of unknown history.

Many thanks to all those who help in this survey!

Regards,

Keith M.

784. ST --> CD-Rom ?

Hallo Leute.

Ein Freund hat ein Problem.

Er hat an seinem MEGAST einen AT-Bus frei (IDE) und

moechte dort ein CD-Rom Laufwerk anschliessen.

Seine Probleme:

1. Ist das ueberhaaupt moeglich?

2. Gibt es CD-Rom Laufwerke, die er sowohl an seinem

ATARI als auch an einem PC anschliessen kann (nicht

gleichzeitig sonderd prinzipiell)?

3. Welche Treiber-Software gibt es da fuer den ATARI?

Hilfen und Anregungen bitte per PM (siehe footer).

Danke

Klaus.

I sometimes use a program called GER2ENG.* to "translate" German docs and the version of the program that I use, c.1989, will do translations to and from a number of languages through the use of user editable dictionaries. Another name for it might be CVTRAN11.* I got this on GEnie but it must be elsewhere. I think that the author was from Toronto, Canada and named Carlos Valente?.

Date: 1995-10-20 00:00:00 UTC
From: martinna@cf.ac.uk
Message-ID: <DGqv59.35H@cf.ac.uk>
Source record: 157404

I'm using GEMRAM and WINX on my ste which means that my tos 1.62 is loaded into memory and patched during bootup.

Does that mean I could put a tos 2.06 image on my harddisk and load that into memory instead.

I know there's a hardware switch board which achieves that effect but I don't want to take the st apart (I'm quite capable but I don't want to).

Thanks

That's due to a bug in the bus error stackframe in STonX 0.4 ;-)
(AFAIR, when the FPU detection routine causes a bus error, the return address
is incorrect, which leads to all kinds of weird problems).

>
>--

It's doubtful that you could get a ZIP to work. It's my understanding that it uses magnetic cartridges (like floppies), not opto-magnetic. Furthermore, you'd need a driver to tell your ST how to talk to it, and it's not looking like that's going to come from IOMEGA.

Sorry.

:
: TEXLDEMO.TOS - I assumed to be self-decompacting but when I open this
: it starts as if loading then quickly goes back to the desktop.
: TEXLDEMO.UPL - some German text file.
:

Yes, I got it from ftp.uni-kl.de (even though its data speed to Oz is
appallingly slow (though not as bad as cnam used to be, but I digress..)

TEXLDEMO.TOS is a self-extracting archive. Copy it to a hard disk with
min. 800K free (plus the space taken by TEXLDEMO.TOS) and then run it.
The de-compressed prog and files take up 782K or so.
If using floppy - you may have to use a RAM disk if you don't have a HD
drive.

Once all the files have extracted, run TEXLDEMO.APP to give you your
spreadsheet.

Since I use Excel 5 (on a 486) all day every day at work, Thank You ASH
for coding TEXEL... I look forward to trying and before too long buying!
The lack of a powerful and compatible spreadsheet has been my only worry
with my Falcon - until now?

From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DGr6C4.LC4@cf.ac.uk>
Source record: 157411

I realise that video digitising software usually needs to run in ST Ram, for example vidi-st and videomaster. I assume this is to do with crucial timing requirements. However animations, and by this I mean not necessarily related to digitising such as those created by cyberstudio, xenomorph, chronos and da-vektor WILL run in TT ram fine. Lexicor's flm playback works in TT ram or directly from the harddrive, DA vektor film format animations play in TT ram or harddrive, etc etc. Also, these work both with or without the VME graphics card.

Infact rendering animations directly from chronos TT in flm format at 640*480 in TT med rez can playback at 60fps with superb quality from TT ram. Even TT low rez 256 colour animations can achieve similar rates, according to degree of movement of large solid areas in the animation.

FLIC players also work in TT ram, e.g. flictc47 and lexicors flicx player.

hi!
You also need to set 2 jumpers (resistors) on the mainboard near the ROMS, since the new ROMs are electrically different from the old ones. Email me for the lowdown if you haven't already recieved the info from someone else.

Yes, but are there Spanish, French, etc. dictionaries available
for GERM2ENG???

I have exactly the same setup and I am running STIK and CAB which give
a connection and quite a good WEB browser. I got it all in one file
called WWW106.zip from Hensa I think.

>
>

???? But of Course. They are included as editable,i.e.changeable, you can
add to them or delete stuff from them,databases. As I recall the program started
out as a German to English translator, so that dictionary was bigger and had
also been enlarged by some guy on GEnie, but the Spanish,et al, dictionaries
were there in a limited but expandable form. I wouldn't set up the translation
bussiness yet but with a hardcopy Spanish to English dictionary you can become
reasonably productive quite quickly. Oh, BTW, it dosen't correct syntax or
anything, it's just a word exchanger.

From: hellman@teleport.com
Message-ID: <469udf$b14@kelly.teleport.com>
Source record: 157428

Hello All,
Is there an ST spreadsheet now that will print the borderlines
around cells to make a table with boxes? I know some of the newer word
processors will make a table with the grid, but I don't know of a
spreadsheet (or data base) that will.
Thanks.

> the Quantum.
>

If your FIREBALL is a SCSI-Drive, don't read further on.
If your Quantum is an EIDE-drive you should set the jumper to MASTER
position and the Seagate's jumper (if it is an IDE-drive) should be set to
the left position. At least my EIDE-FIREBALL 1080 works in my Falcon
properly this way.

Has any one heard of this scanner, and have you tried it on the atari.
I would appreciate any help you could give me about flatbed scanners
and which ones you have found to be the best. Thankyou

I have a friend that registered FreeZe Dried Terminal twice and never
got his Registration .KEY. I was told that a Public Domain Registration Key
exists. Could someone tell me if this is so? If it's true, could someone tell
me where to find it? And if this message is innapropriate and no key exists,
please let me know.

Please direct all replies to E-Mail as I don't usually read the NewsGroups.

Pardon my ignorance, but what is the difference between AHDI
compatible and non-compatible drivers? The ICD utilities offer AHDI
compatibility as an option. Is there any good reason NOT to select it?

transfer rates of 2700..2800 MB/s, using HDdriver with no (!) caching.
The "multiple read/write" -feature was switched on. By the way, on
Falcon at least, the driver used seems to affect the IDE results
considerably. When I tried HUSHI 6.10 multiple r/w switched on, the
results fell about 200 kB/s..!
>
>Someone here mentioned that his Falcon gave 3300 kB/s with Seagate

higher bus speed, pretty nice data transfer rates can be achieved on
Falcon.

Yes, with the Apex Media upgrade supporting the PC FL* frame
rates, it would be interesting to see how the video clips run.
Toad should have Expose in a week or two and David at Titan has
shipped my upgrade so i'll be testing soon :) I just need to decide
on which IDE drive to purchase.

PC-users probably use some kind of a caching program, many results from
PCs seem to me unnaturally good.. Don't know about this 4000 kB/s,
though. New IDE-controllers should be fast..

I have played with smartdrive and the controller card came with
a special driver. I don't know if the "rate head" program supplied
gave performance of the drive direct or with the cache active.
At any rate, with CAB and STiK and NOS I am just about to give
the PC to my girlfriend. I really do like her, my girlfriend:).

>it to work! If I attach it following the directions, it just sits there,
>either in the internal or external. My other Seagate registers, but not
>the Quantum.

What SCSI driver are you using? If it is the Link (Link ONE) then you will have problems unless the Fireball has manual jumpers to switch the parity over. Link needs parity disabled before it will work correctly with a lot of modern drives, unfortunately more and more modern drives are starting to REMOVE the manual parity jumper cables...

...I'm having similar problems myself, the last two Quantums I have bought have NOT been compatible with the Link. Link 2 will probably run it if you can afford to throw another $100 at the problem, or the older ADSCSI+.

<sigh>

Source record: 157305

Hello ! I have a 40 Mb hardrive from a pc is there any clever atari or electronic experts out there who know how to turn it into a suitable drive for my atari st FM.
Also how can i make my own ram. Do you have any pcb and componant details for making extra ram for my 520 ST FM.?

835. CAB & Minix

Newsgroup: comp.sys.atari.st
Date: 1995-10-21 00:00:00 UTC
From: allmidd@xs4all.nl
Message-ID: <814289764_OASIS_@xs4all.nl>
Source record: 157306

In the CAB docs it is recommended to use a Minix partition to handle long HTML names better. As I am using Geneva 1.004 + MiNT + a Minix partition I wonder about the followuing part of the CAB docs:

On Minix partitions the x-flag of the CAB.OVL file must be set otherwise the modul can not be started.

How do I do that? BTW I have a CPX module "flags"

From: tderrick@acpu.com
Message-ID: <95102200000920763@acpu.com>
Source record: 157309

Bill Hallman posted an Atari faq to this group. Unfortunately,
somewhere along the line, it got pretty badly scrambled. My copy is
not very useful. Did anybody else have this problem? Or did it go
bad somewhere in my system (or my access site)? If it went bad
before it got to Boise, would someone take the time to repost it?
ATM, the only net access I have is through csas. I would really like
to do some work on the faq, and possibly print it in our local
newsletter.

851. NOTATOR/CREATOR SL FOR SALE!

Newsgroup: comp.sys.atari.st
Date: 1995-10-21 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <JPPHIhK.johnhechtman@delphi.com>
Source record: 157446

**** FOR SALE - NOTATOR SL <AND> CREATOR SL ****
.
1-C-Lab Notator/Creator SL package. This is actually _2_ sets of
disks for both Notator _and_ Creator, along with _2_ dongle cartridges,
one for Notator, one for Creator. You could set up _2_ systems with
this software - one w/Notator, one w/Creator (of course you'd need two
ST's as well).
.
The Notator disks have the latest updates to version 3.21 Full
manual & disks all in perfect condition. Only $175 plus shipping
this is the _exact_ same program that lists in the Toad catalog for
$249! Only _my_ version has the latest updates direct from Emagic!
This is a fully registered version and ownership would be assigned to you
with Emagic. Notator SL works on STF/STE/Mega STF/Mega STE, not TT or
Falcon compliant.
.
If this program is so great, why am I selling it? We got a Falcon and
Notator Logic! Works like a charm, but now I have to make back _some_
of the upgrade cost (grin). Please send replies to my Internet address

>and V-Sync (9 and 12) or are there any other signal to be provided?

Don't forget to connect gnd.

Which connector are you talking about - what shape, & how many pins
does it have?

The Falcon has RGB on pins 1, 2, 3, the ST has RGB on pins 7, 6, 10,
SVGA RGB is on pins 6, 7, 8 of a 15 pin D but H sync is pin 13 &
V sync is pin 14.

You should check that your monitor inputs are analogue & broadcast
frequency.

>2. The monitor is labeled as 120v 60Hz. I think it was for Amercian products but
>I'm in the UK. I have to get a step down isolation transformer but what do I do
>about the 50/60 difference. Do I just supply a 50Hz supply and provide a 60Hz
>siganl from the falcon, or should I provide an 60Hz supply?

I would expect 50Hz mains to be ok. What did they use at work?

You can still set the Falcon video to 60Hz, eg. using a CPX.

If you don't get a synchronised display I would suggest you switch-off
and start checking.

Monitors are easily broken by out of spec. frequency signals.

Good luck

853. VT100 Telnet Services

Newsgroup: comp.sys.atari.st
Date: 1995-10-21 00:00:00 UTC
From: simon@orme.u-net.com
Message-ID: <814296000_OASIS_@orme.u-net.com>
Source record: 157448

Hi just got an auto prog called VT100EMU which apparently replaces the STs VT52 emulation...

A while back I read that Lynx and Gopher were available via Telnet servers... Assuming the emulator cures the character problems, where are these servers and are any other useful things now open to me ..... I have got the last Yanoff and BigFun lists, but there's no mention of web/gopher access through telnet....

Cheers,
Simon..

PS anyone having success with STiK and IRC? Most of the servers it has in the default seem very slow, and the /list command doesn't seem to like suffixed commands -min etc... when I've played with it. I won't even attempt to list the probs I've had with CAB.

I've just obtained a 17inch RGB monitor from work (they where going to throw it away!) and I have two questions - one on signals, the other electrical.

1. I've got a Falcon with the falcon->st video adaptor so I can switch between my TV and SM124. Should I just make a lead with R,G,B (pins 6,7,8) and H-Sync and V-Sync (9 and 12) or are there any other signal to be provided?

2. The monitor is labeled as 120v 60Hz. I think it was for Amercian products but I'm in the UK. I have to get a step down isolation transformer but what do I do about the 50/60 difference. Do I just supply a 50Hz supply and provide a 60Hz siganl from the falcon, or should I provide an 60Hz supply?

Does anybody know where I can find a manual for Cubase Audio Falcon...The guy I bought my setup from did not ever give me the manual, or some of the original disks (if there are more than 1). Anyway, Steinberg won't gie me a manual (or sell me one) because I did not originally register the software through them. I run into problems with the program every day, and I really need the manual or a copy. Please let me know if you can help.

Shane

858. *** Needed! One hard drive... ***

Message-ID: <46cag0$or5@jake.esu.edu>
Source record: 157311

If anybody has a hard drive they'd like to sell me PLEASE let me know. I need to get one as soon as possible, so the best offer someone can make me and the sooner they can make it, the happier a camper I will be :). Please respond via e-mail. All responses are greatly appreciated.

P.S.> One more thing I'd like to say. I think we all deserve a great pat on the back for all the help we give each other on here. Every time I know I have a problem with my Atari I know the answer is just a newsgroup away. Every time I get in contact with people who have answers they are always happy to help and answer whatever they can, no matter how trivial or how completely baffling. I've belonged to newsgroups where half the people are too arrogant to help others and those others are too clueless to know thier shoelace from their belt buckle. This group on the other hand is full of knowlegable people who are happy to help others with any problems they may have. So it is with that in mind that I say "thanks" to all the people who read this group and answer posts. It truly makes owning the computer a joy :)

>able to work that way without a small utility/program. My question is:
>Does anyone know the name of this small program (and perhaps where it is
>available)?
>Question no 2: Is there any other word processor that works in a similar way?

It sounds as if you're still using the first version of Signum.
In the latest version, "Signum 3", you can write from right
to left without any special utility. I've never had occasion
to try it though. By the way, Signum 3 is a completly rewritten
program with lots of new features.

As far as I know there's no other TOS-program for that can write
form right to left.

Kind regards

865. WORM DRIVE ON AN ST ???

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10221995.170533@empyr.dircon.co.uk>
Source record: 157318

Hi, Has anyone managed to connect a WORM drive (Write Once Read Many) to an Atari ST ?

I have a Maxoptics RXT800S 800Mb optical SCSI WORM drive and I want to connect it to my ICD AdSCSI+ host adaptor. I don't yet have any media for it (5.25" cartridges), but I have located a source for these.

So... I don't want to pay out for a cartridge if the thing won't work with my AdSCSI+.

I had heard that because of the Write Once nature of the drive, that it will not work without special software drivers - something to do with the host computer wanting to update the FAT tables as in a normal HD, but being write once, you cannot amend the FAT tables, but have to write new ones... or something like that !

I have plugged the drive into my AdSCSI+ and the ICD software reports it as being a WORM unit with 'removeable media'. Now whether this is just displaying the data returned from the WORM drive in a verbatim fashion, or whether the ICD software is *really* recognising it as a WORM unit, I don't know.

Any ideas ?

Cheers,

Kevan.

From: chriswil@southern.co.nz
Message-ID: <46ef4s$mbr@southern.co.nz>
Source record: 157326

Hi There...

I wonder if anyone knows if there is a Falcon030 friendly graphics package, capable of writing out 256 colour X(IMG) images that I can use with Deskpic 5. The program MUST have a 'Preserve System colours' button, as I have had no end of trouble doing this with GemView 3.15 and the 24-bit raytraced Targa files I would like to dither down for display as a backdrop. Is such a program a reality? If so, where can I snaffle it!!. Also, is there a Falcon030 specific backdrop accessory? I would think that one has been written by now, to utilise the enhanced video the Falcon offers over the ST and TT.

Thanks for your replies...

Chris Wilkinson, Christchurch, New Zealand.

For Sale - only £100
****

Falcon Speed PC emulator, lets your Falcon run Dos and Windows programs in 16 colour VGA mode. Very easy to install, I even did it myself and I'm a complete novice when it comes to electronics. No soldering required, it just plugs into the expansion socket of the Falcon. I'm asking 100 ukp for this, quite a bargain really as Compo are advertising them for either £199 or £229, I can't quite remember.

Email me if you are interested.

Cheers.

Most of the german Atari ftp sites carry it.

A random sampling from off the top of my head:
ftp.uni-erlangen.de
ftp.uni-paderborn.de
ftp.fu-berlin.de
ftp.germany.eu.net

At least one, probably several, of the above has it.

Note, though, that you need at least a 68030 CPU to run it.

881. AVALON - Digital Editing HELP!

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: sbushman@igc.net
Message-ID: <46c8ik$9f4@IRIS.igc.net>
Source record: 157334

I was wondering what in the heck AVALON is...I have heard many comments here and there, and I think that it may be something I can use...

I am looking for software which will read an AIF file off of my hardrive, and give me a wide spectrum display...the more bands the better! I need this to try and position my vocals, guitar, and bass in the holes that are left after the drums are recorded. I really need some type of AIF digital processing software. Also, does anybody know if DiNR or a similar noise elimination software package is available for falcon? It supposedly (on the Mac) takes three seconds of audible noise, and eliminates that exact waveform from your mix...thus taking any noise away (great for remastering old tapes!)

Also, can you use a CD writer like the pinnacle with the Falcon?

Shane

883. Police RPG Manual

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: lattert@nbnet.nb.ca
Message-ID: <46e7nj$175q@darwin.nbnet.nb.ca>
Source record: 157336

Police RPG

Introduction:

The Point of this PBM (Play by mail) game is to allow those people who have always wanted be an undercover cop or a street cop etc.. but just couldn't find the badge, the car, or the really neat gun. It alows
people to escape from the pressures of modern day life. It's a place where people can get girlfriends or wives (Boyfriends, husbands.) without having to worry about what other's will think. It's a place where
people don't have to be afraid of messing up. This is called an RPG.

The way this RPG operates is through episodes. Each episode will be like an episode of Colombo or Sherlock Homes. Although they will last much longer. An episode will be assigned to a group of officers who's job is to track down the villain and arrest him.
Think of it as a lot of people writing a story, but taking turns. When it is your turn, you will right your section of the story.

Usually, when you write your section. You will include the other characters but will focus on yours as the main character. But to make the story interesting you should make yourself a super hero. You present yourself with problems and give your character weaknesses. And you usually leave off your section of the story when something dramatic is about to happen, and you let the next person to write try to
figure out how to solve this problem.
While this can be thought of like this, it isn't exactly the same. You don't have to wait for "your turn" before you write your addition to the story. You can write whenever you want. But don't hog all of the glory. Try to include other people in your section of the story.
An example is provided below:

There are three people John who controls his character Matthew, Peter who controls his character chuck, and Ray who controls his character Bob.

John and Peter are partners.
Bob is what can be considered, the villain.

John (Writes first)

Subject: California: Lytton: Matt and Chuck catch a dangerous speeder.

NRPG: Hi Peter, how was your vacation?

RPG:

Matthew pulled over the speeder. "How about you handle this one
Chuck."

(John is done writing.)

(Now Peter writes.)

Subject: California: Lytton: Chuck gets knocked out.

NRPG: My vacation was great.

RPG:
Chuck went to write a ticket but the speeder knocked him out.

And it continues like this, but definitely not as brief.
When you are writing, you don't only control your person
but other people too. You know how their characters may act or react
by reading the biography's of their characters. (Which will be given
to
you once you start on the same mission. Biographies tell the other
people how you character generally acts. Don't worry they're not as
long as you may think.)
You can not, however, make all the decisions for them. You
can do minor things like make their character chase a man into a
building or something, but you cannot make major discussions for
them. Ex: Make their character accept marriage proposals or have their

character killed.
You can put them in the position to answer to the proposal
and end your section of the story and then let them write their
section
which will include the answer, or if you ask them in advance, then you

are allowed to write their answer into your section of the story.

And vise-versa.

When writing in your section of the story you have to tell
others what your section of the story is about in the subject line as
shown above.

Remember, your characters have personal lives, too. Some may have
wives or whatever. When this occurs you are responsible for them. If
you bring a character like a wife that isn't controlled by anyone into
the
game, you are responsible for them.

Ex: Continuing on the fact that you have a wife which no one else
controlls.
Other people can write for her in their section of the story,

but not major things, just like with the real characters. You also control
her major actions. Say if you want her to get murdered or divorced or what ever, these characters that you own but don't have any "real" importance on the game. And you do not have to constantly include them in the story.

Characters like this are called NPC'S (Or Non Playing Characters.)

You may have as many of these as you want. You may also have as many PC's as you want (Playing characters, characters that you

control.) But just make sure that you can control all the players you have.

When posting you must post to at least three groups of people: 1. The other people that you are currently on a mission with.
2. Your GM (Explained later)
3. And your villain or groups of villains. If the Villain is a PC.

Yes it is possible to have an NPC Villain. If there is no one that currently wants to be a villain the NPC Villain is controlled by everyone.
And yes a villain can have NPC's for himself. Say hench men or whatever.

One last aspect of posting is writing to someone else while it doesn't have anything to do with the story. Say if you wanted to discuss your next move or discuss permission for marrying someone else's character or whatever. The Subject should have the words NRPG in it somewhere. Nrpg postings don't have to go to everyone or the Gm. Just to the person you want to talk to.

This concludes the basic posting. To understand more how this works check out the news group: alt.starfleet.rpg
Who knows you may even want to join that.
Warning: When visiting this news group refrain from posting unless you want to join.

GMs are people that read all the posts from people in the group. They make sure that there are no Psycho cops about or that no one is breaking the cop rules without any relation to the story. They can
also decide whether a cop should receive a promotion due to good work.
People that volunteer to be GMs usually have other PCs, however, you can not Gm for your self or a group containing yourself.

If you want to become a villain you must have had at least one promotion. You can not be a villain against your self or a group containing your self. You don't have to loose in the end but you can not

kill any one etc.. without their permission.

Positions are chosen by you. The following positions are
available:
Narcotics: Deals with stopping the flow of drugs. (Undercover work.)
Homicide: Deals with the investigations of deaths. (Undercover work.)
* Evidence Analysts: Deals with analyzing discovered evidence.
Street Cop: Patrols the streets.
* S.W.A.T: Back-up for officers that need it.
* Bomb Squad: Deals with the disarming of bombs.
* Dispatch: Tells other units where to go and what's going on with the

other units. Also gets bomb squads ready etc. per a calling in
officers
request.

And any others that may come about.

Anything marked with a star usually involves a person that should have

another PC, as those positions aren't as frequent as others.

The system also works in ranks, explained in the next form. If you
rank
high enough then you may become appointed Captain of Homicide or
Lieutenant of Narcotics....it's up to you and how hard you want to
work
as a cop.

To start your career as a police officer write to lattert@nbnet.nb.ca
with the information shown at the bottom of this form.
Use the subject: California: Oakhurst: Police Academy.
Write your arrival to the Police academy and what you are thinking the

whole time.

Here, you will get hands on experience on how to play our RPG. You
will get one day experience on the streets as a street cop. If you can

handle that then you will appointed to the Police Station as a rookie.

After you arrive at your desired position you will meet your captain,
latch on with a bunch of cops or maybe even one other cop....then you
begin a mission.

Beginning the mission:

Before you go off chasing a villain or group of villains you must be
informed of it. Board meetings are called before a mission begins.
You,
whoever else you want to bring on the mission, and the superior of
your division will meet. The superior will inform you of what your
current mission is. Then you and your peers set out on the mission.

The Procedures of a mission:

In order to start tracking down a villain it is advisable to visit the scene
of the crime to try to find evidence that may help you find what the evidence may be like or where he may be going. Now this may not always work but it is a good start.

Chain of Command:

Patrolman (Must patrol your city.....you promote from this position quickly.)
Detective (Are able to become a GM. Able to choose your division.)
Detective Second Grade
Sergeant (Rank needed to train cadets at the police Academy.)
Captain (Rank needed to head up Homicide.)
Lieutenant (Rank needed to head up Narcotics)
Chief Of Detectives
Deputy
Deputy Inspector
1st Commissioner (Needed to be in charge of a police station.)
Commissioner (Needed to be in charge of an entire state of stations.)
Admiral (Needed to Command all of the stations.)

Every so often all of the department heads will meet to discuss officer's performance or possible missions.

Note: If an officer can come up with a mission....he can email Admiral

Kristopher Parks or Admiral Matt Stevens and they will take it into consideration. Both of their address are lattert@nbnet.nb.ca

Current Police Stations:

Commissioner Ray Stevenson

California

Oakhurst Police Academy (Sergeant Dooley)
Lytton Police Department (1st Commissioner Jeff Arseaunalt)

(All of these peoples positions will be replaced once characters make the ranks. Also more police stations will come about when they are needed.)

When other police stations come about and if you are not happy at your current one you may request for a transfer from the superior of your division.

If this appeals to you.....write to me at lattert@nbnet.nb.ca
Include the information shown below:

Real Name:
Character Name:
Age:
Sex:
Physical Description:

Hobbies:
Likes:
Dislikes:
Ambitioned Position:
Email Address:

Remember the above information is for your character and not for you. (Except for real name which should be a name we can call you....of the

record.)

(In the ambitioned position area put either Homicide or whatever. Or another position you can think off.)

884. Le Redacteur 3.5 (english) For Sale!

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <Z3IkotY.johnhechtman@delphi.com>

***** LE REDACTEUR 3.5 (English version) FOR SALE *****
.
Latest version of Le Redacteur for sale. This is absolutely the
fastest word processor program I've seen for the Atari. It's used
extensively by French newspapers so each writer can have a stand-alone
program to work in. It has so many features I can't begin to enumerate
them. It has support for various fonts and symbols, reconfiguring the
keyboard, supports both bitmap and vector graphics. It also has a broad
variety of style and print options, creation and use of libraries, built-
in dictionary and a slew of support programs.Not to mention the 650 page
manual (grin). A special feature of Le Redacteur is that it will work in
both native printer fonts (for speed) _and_ use other fonts/graphics (for
enhanced quality).
.
This program sells for $149.95 at Toad, but this copy could be yours
for only $75 plus shipping! I got this copy in a trade deal and since I
use Papyrus, I have no need to learn another hi-power document processor!
Sorry, this price is firm (it's too low already) so don't try to haggle
with me about it. However, I might consider items in trade (grin).
.
Please send replies to my Internet address at Delphi - it's
"johnhechtman@delphi.com". Or you can call me at:
.

885. Spectre GCR / System

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DGvDFn.BuB@actrix.gen.nz>
Source record: 157338

I've been using System 6.0.5 on the Spectre GCR, which is fine, but I've noticed a lot of applications (the few that don't need system 7) need the enhanced sound of 6.0.7. Does this version run okay on the GCR, and if so, any ideas where I can get it, as info.apple.com only has v6.0.5 and 6.0.8 in useful versions. Anyone using 6.0.7 with good success?

Apparently 6.0.8 doesn't like the GCR, and apparently the best versions are 0.4, 0.5 and 0.7 but which are the advantages of each? How stable are they?

886. Munsie/Choplifter '95

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DGvDt4.DIA@actrix.gen.nz>
Source record: 157339

Several months ago, I sent my registration to Dave Munsie (Munsie Entertainment) for Square-Off and the "will be released any day now" Chop-Lifter '95. The disk for Square-Off never arrived, but I managed to email him and get the registration code that way. However, despite the fact that Choplifter '95 was due to be released several months ago, and was supposedly finished. I have heard nothing from him, and can't get a reply from him via any means. I need the money at the moment, so I'm getting pretty annoyed with the whole Shareware concept, as out of the couple of dozen programs I've registered, not a single one is still being actively supported. Most ceased to be supported about a month after I sent the money. And what with some of the obscene fees people charge for this software, I'm none too happy about it. (Mac shareware is substantially more expensive, and there's very little that isn't shareware, PD/freeware seems to be an alien concept on the mac).

Does anyone have any information on what Munsie Entertainment/Dave Munsie is doing? And what are my chances of either getting my game, or my money!?

I think I'll give a miss - I only wanted it for the text web browser so I could download a few html files to test on CAB. CAB's broken you see. I must be the only one who got it working first time, only to have it work twice ever. :-(

Hello all,

I finally found the Neodesk 003 patch disk on atari.archive - I've also noticed that the Geneva 004 patch is there put still in the New directory so it can't be ftped yet (how frustrating)_.

Has anyone gotten the AV server part of Neo 003 to work? I've been using Thing for a while under MultiTos and it works fine as an AV server but Neo 003 doesn't seem to work at all in this resepct - everything else seems fine though.

Anyone else have any experience with this?

Thanks,
Sam

The best site to use as he is in the UK is src.doc.ic.ac.uk. In the
directory pub/linux (I think) there is a mirror of the tsx site that
has all the necessary files.

Regards.

891. looking for Carolina

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: Rein_Bakhuizen.van.den.Brink
Message-ID: <308a9044@p87.f503.n286.z2.fidonet>
Source record: 157344

Sometime ago I had the pleasure finding a nice CALAMUS typeface with a short notice attached to it. I tried to contact [december 1993] the designer but until now no results. Maybe someone might know whether he's still among us Atarians?

"Welcome to Carolina!

I Hope You Enjoy your stay.

Carolina is a Korinna look-alike that's as beautiful as its namesake. A whole lot of work went into making Carolina as sweet as can be. After several weeks spent with a ruler and protractor, a calculator, some photocopies and vague memories of high school algebra and geometry, it's finally done! I think that you'll agree that it was well worth the wait.
Carolina is named after the great state in which I live. I also chose the name Carolina because it evokes the same classic images as the font does (and it is also the font used on the South Carolina license plates).
Carolina makes for both a wonderfully decorative headlines and body texts with that charming Southern style. It's not only beautiful, it's functional.
Carolina is shareware and you know what that means. For as beautiful as Carolina is, I am only asking $11! As a bonus to all the nice people that send in their registration, I'll send out a disk with the Italic, Extended and Extended Italic versions thrown in.
My address is:
Mark N. Crislip
Box 5311
Columbia, SC 29250
If you have already sent in you registration for Opiate, I will send you Carolina for only $10. Or you can register Opiate & Carolina together for $21 and get the full sets of each. What a deal!

Any suggestions as to how to contact Mark Crislip are most welcome.

I know, and it seem like the problem is more serious than i thought.
I got a message from a Zyxel guy, and he told they are aware of the problem
as it happens on some machines where the serial signal isn't _enough_
stable for this new modem. The thing is, this new modem demands a 100%
stable signal, otherweise this problem will appear.
There is a fix around it, but the modem need to be hardware changed to
suit more unstable serial ports.

(Reading between the lines, it doesn't mean a fault in our computer. It's
simply because the modem ask more than what serialports normally
handle. Thats also why Zyxel will change this for free, whenever someone
is having this problem).

But thanks for your suggestion anyway. You're teori was absolutely correct

896. Cubase Audio Manual

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: sbushman@igc.nim
Message-ID: <46c8n1$9f4@IRIS.igc.nim>
Source record: 157349

Does anybody know where I can find a manual for Cubase Audio Falcon...The guy I bought my setup from did not ever give me the manual, or some of the original disks (if there are more than 1). Anyway, Steinberg won't gie me a manual (or sell me one) because I did not originally register the software through them. I run into problems with the program every day, and I really need the manual or a copy. Please let me know if you can help.

898. AVALON - Digital Editing HELP!

Newsgroup: comp.sys.atari.st
Date: 1995-10-22 00:00:00 UTC
From: sbushman@igc.nim
Message-ID: <46c8ik$9f4@IRIS.igc.nim>
Source record: 157351

I was wondering what in the heck AVALON is...I have heard many comments here and there, and I think that it may be something I can use...

I am looking for software which will read an AIF file off of my hardrive, and give me a wide spectrum display...the more bands the better! I need this to try and position my vocals, guitar, and bass in the holes that are left after the drums are recorded. I really need some type of AIF digital processing software. Also, does anybody know if DiNR or a similar noise elimination software package is available for falcon? It supposedly (on the Mac) takes three seconds of audible noise, and eliminates that exact waveform from your mix...thus taking any noise away (great for remastering old tapes!)

Also, can you use a CD writer like the pinnacle with the Falcon?

901. Sattelite prediction programme

Newsgroup: comp.sys.atari.st
Date: 1995-10-23 00:00:00 UTC
From: brenjb@hg.uleth.ca
Message-ID: <46eotb$1f1@holly.cc.uleth.ca>
Source record: 157205

I used to have a wonderful programme for my ST that would estimate and display the location, path, and footprint of sattelites, given their initial position and speed, etc... I remember the documentation specifically mentioning that it was even better in a machine with an FPU (i.e., a TT) Since fiddling around with it, and deleting it, and getting a Falcon, and the passage of two years, I want to try it out again on my Falcon BUT I can't find it anywhere.

Anyone know where it may be found?

You can enter the sector size in partitins when you switch from MByte to
Sectors in the partitioning dialog box.

>ICD Pro, though recognized this partitioning correctly, and set in AHDI-
>compatible mode, isn't compatible with HDdriver/SCSItools-method of
>partitioning. My last partition disappeared completely, after ICDformat
>announced it had succesfully re-built this partition (larger than it used
>to be).

The method of HDDRIVER/SCSITOOL is fully Atari compatible, i. e. compliant
to the AHDI 3.00 Release notes from 1989. If other software has problems
with this partitioning scheme it is not AHDI compatible.

>Can it be done at all, afterwards? Is "re-build partition" only capable

If you don't want to loose your data on this partition it is not possible to
change its size. If the data are not important you can change the size with
a hard disk monitor.

Sure an FPU, but I don't know about the RAM or the disk.. Perhaps if you want to run X you'll need lots of memory and disk, but Linux seems quite small and doesn't seem to need a lot of disk space. My root partition has about 3Mb of files, my /usr partition has about 20Mb - quite small really!

I wouldn't call it featureless... It was the first art package to support
all colour modes on the Falcon...

Yes, not a great program, but not too bad - for the Falcon. (not much good
for an ST - gem is to slow, and its main advantage disappears...)

>Any advice would be greatly appreciated. Right now SCSI Probe tells me
>that it reads a SCSI device but says there is no data on it!

With the demo of MagiCMac you can only access to the drive C (Magic_C) and
the floppy drive.
With the full version of MagiCMac you also access folders and drives in
format Mac, and SCSI drives in format Atari (AHDI compatible). Even the
CD-Rom can be used.
So I have folders on the Mac disk which are used by MagiC as Atari drives,
and I use Atari formated Syquest.

And an Atari Syquest cartridge (or hard drive) will not be recognized under
Mac mode, it's normal, but it's fully usable by MagiC.
But only with the full version.

Hope this helps.

Try ftp.uni-kl.de instead.
I must say though that I am very disappointed with the 'MiNT-compatible' version of GEneva - if the demo is anything to go by. It crashes every 5 minutes or so, requiring a complete re-boot. It wont run Thing without MiNT.

It is very fast, much faster than AES4.1 - but AES4.1 runs stabley for hours on end, and is compatible with almost evrything. Geneva is VERY unstable at the moment....major bummer, I considered buying it to use instead of AES4.1, but it's not nearly reliable enough.

Even without MiNT, it bums out loads, and locks if you load Fsearch. And CLA's colour icons don't work right under Geneva (they are ok under TOS4, AES4.1 and MagicMac).

Craig.

This is consistant with what I have learned. SCSI-3 introduced bus
arbitration, which the Atari HARDWARE does not do (didn't know about it in
1990 or so when the TT was designed!). However, the newer SOFTWARE drivers
can do this. For this reason you can never boot off of a SCSI-3 drive, but
you can still use it once your driver loads (given it's one of the new kinds).

>I usually recommend people not to buy the Quantum drives because there is so
>much trouble getting them to work. I use Conner disks myself and they run like
>clockwork. I believe that most other drives work too.

I have found many people using the newer Quantums, but they have the newer
HD drivers, and they still use one of their older drives for booting
purposes.

Anyway, to put closure on my story, I sent the Fireball back and got a
Trailblazer. The Trailblazer is only 850 megs, but it is listed by Quantum
as a SCSI-2 drive, not SCSI-3, and therefore should work as a boot drive.
We'll see what happens when it gets here.

I'm sure you get a warm fuzzy feeling inside knowing that you've just pirated your TOS ROMs and have the balls to brag about it on the Internet. Don't be surprised if some people come knocking on your door soon.

Unfortunately the makers of legitimate Atari ST emulators (Gemulator, Magic Mac, Janus, etc) don't have the luxury of selling products that use pirated TOS ROMs. I'm sure we'd all like to, but because we don't care to have lawsuits on hands, we use either legitimate TOS ROMs or as in the case of Magic Mac, write a new OS.

So all I have to say is it's rather foolish of you to go on the Internet and admit to being a pirate. Unfortunately the makers of STonX don't appear to have any regard for copyright laws either.

I've said it before, and I'll say it again, Atari users are all a bunch of damn pirates.

920. Atari Games For Sale

Newsgroup: comp.sys.atari.st
Date: 1995-10-23 00:00:00 UTC
From: mlake@dgs.dgsys.com
Message-ID: <46ghkk$oir@DGS.dgsys.com>
Source record: 157224

ST Software for sale (all items come with original disks and docs
except where noted):

Elite 9
Epic 9
Legend 9
Warlock 5
Baal 5
The Killing Game Show 6
Rick Dangerous 7
Rick Dangerous 2 6
Awesome 6
Parasol Stars 6
Captain Blood (not STe) 7
The Gold of the Aztecs 8
Stunt Car Racer (not STe) 8
Xenon 2 8
Dark Castle 6
Hole-In-One 5
Lemmings 9
Sleepwalker 8
Terrorpods 5
Lost Dutchman Mine 7
10th Frame 6
Gauntlet II 8
Vroom 9
Super Off Road 6
King's Quest II 6
Leisure Suit Larry II 6
Oids 7
Paperboy 7
Toobin' 7
Anarchy 8
Speedball 2 9
Defender of the Crown (no docs) 3
Arcade Fever (Stormlord & Onslaught) 5
Super Space Invaders 5
Oblivion 3
Paradroid 90 5
Shanghai (no docs) 3
Vampire's Empire 3
C.O.L.R. Object Editor 3
Targhan 3
Black Lamp 3

Please add $1 per total order to help cover shipping.

>floppy.

I use a Falcon/Mega 4 with my K2000s and an EPS Classic.

I have found a world of compatibility between the platforms through the Falcon recognizing and being able to manipulate KRZ files, the Kurzweil being able to use EPS files, and the Mega4 using Disk-Wizard being able to do almost EVERYTHING with EPS files . . .

There is a very nice PD program called MODFILE that will take all the instruments from a mod file and sends it via MIDI to your K2000 as individual samples and creates keymaps along the way! Really interesting- of course, you must have high quality MOD samples in the first place to have any usable products. . .

925. GEM for PC's?

Newsgroup: comp.sys.atari.st
Date: 1995-10-23 00:00:00 UTC
From: Elmar Vogt <elmar.vogt@rzmail.rrze.uni-erlangen.de>
Message-ID: <46g2ho$1pf@rznews.rrze.uni-erlangen.de>
Source record: 157229

Howdy!

I dimly remember there once was a PC produced by Schneider, which
would be shipped with GEM installed.
Does anybody know whether this was an IBM-compatible, and whether there
were GEM versions for PC's ever? Is there still any support for it?

Just wondering, since it might be a way to give the ST a new live-
with its GEM/TOS controlling a PC-zombie... :-)

Cheers,

Elmar

To print in html format (with graphics and all), you need a
postscript-compatible printer, AFAIK. 'Course, that may depend
on which browser you are using.

>
>Has the German-designed Omicron Basic, which was packed with
>all STs for several years in Europe, ever been seen in the U.S.?

I did a review of Omicron BASIC for Start magazine several years
ago, back when Antic Publishing was considering picking up the
U.S. distribution rights for it (they never did, BTW). It's never
been distributed in the US, AFAIK.

>Does anyone know if it would now be public domain? (since one didn't pay extra
>for it).

Legally speaking, including it with the machine most certainly does
NOT make it public domain. It just gives you, the user, a license to
use it. But if Omicron is out of business, I wouldn't worry about it.

> Internet and admit to being a pirate. Unfortunately the makers of
> STonX don't appear to have any regard for copyright laws either.
STonX does _NOT_ come with a TOS image, it is up to you to use your OWN
copy. It is after all, for private use - I'm sure, for instance, that most
commercial software would not preclude you from installing there latest
program on your laptop _and_ home unit - would _you_ buy two copies?

> I've said it before, and I'll say it again, Atari users are all a bunch

: I'm sure you get a warm fuzzy feeling inside knowing that you've just
: pirated your TOS ROMs and have the balls to brag about it on the
: Internet. Don't be surprised if some people come knocking on your door
: soon.

I am not sure what is illegal about this. It is his machine, he owns
the machine that the TOS ROMs are in. He didn't go out and get someone
elses machine and make a copy of the ROMs. Most software vendors allow
you to make copies of the software, under some of the following common
stipulations:

The copy is for archival purposes. ie: backup. This doesn't work here.

The copy is to be used on one system AT A TIME. In other words, you
can run multible systems, so long as only one is in use at a time.
Like a laptop versus a desktop. Win95 license allows you to install
Win95 on your desktop at work, and your laptop at home, because there
is a small chance that you are going to use both at the same time.

I would like to know the outcome of this. I currently have two
machines: an STe, that is dead; a Falcon that works. Since STonX
can't use TOS 4.04 (Falcon), I can use the STe. As a matter of fact,
the TOS 2.06 ROMs for the STe are not even in the machine. Since the
machine is dead, if and when I toss it, I still want to keep the
TOS 2.06 since I paid $60 for them.

Yep i use it all the time. It's just a faitly simple board that you have to push
(pretty damn hard!) into your sockets and if possible connect a wire with a clip
to the bottom left or your ST which allows your ST to reset when you change Tos
versions rather than just crashing! It's a really good board, I got mine with
ROMs for about 60UKP, i think one without the ROMs is about 20-30 I love it!

It's the same with me - so it really seems to be a problem with the
programm. But with some http-pages I noticed, that it worked after trying
it three or four times. (So I wonder if it also could be something to
do with the files in the cache of the home-server?)

But also I'm still not sure what the best configuration for stik is. If
anybody could give me some hints about the tcp/ip parameters I'd be very
thankful.
bye

935. Trade: Atari 520ST + for ..?

Newsgroup: comp.sys.atari.st
Date: 1995-10-23 00:00:00 UTC
From: jjsosnin@cs.millersv.edu
Message-ID: <46gi6j$chl@jake.esu.edu>
Source record: 157239

I picked up an Atari 520ST at a yard sale, took it home, and played this nifty shareware Asteroids game on it. Then it stopped, and ever since I can't get it working. I have no idea what is wrong with it, but I really don't have the time to play with it. If you want it, I'll trade it for just about ANYTHING.

What I have: Atari 520ST, mouse, 2 floppy drives, and a color monitor. The monitor seems pretty nice, if I could get a cable that would let me use RCA plugs on it, it would be a nice little VCR/game monitor.

What I want: Anything. What I REALLY want are any LJN AD&D action figures from around 1983-1985. Other than that, if you have something sitting around and you want this, let me know and it's yours. You may have to help with shipping costs depending on what the trade is for (if you trade be a candy bar, you will have to pay shipping).

Hope someone can find a use for it...

Josh

Amstrad produced a PC that ran GEM in the UK years back. I think it was for
an AT, or maybe a 286. It might be worth checking that out.

I don't know about the demo, but with the working version
just plug in a AHDI formatted drive and MagicC can read it.
(But the Mac OS can't).

>say!

Does it really say so? Then this is a typo or so in the English manual. At
least the German manual does not say anything about it, or does it?

>I connected two large Seagate IDE-drives as "master and a slave" - and
>bingo! No problems at all. Both HUSHI 6.09 and HDdriver immediately
>recognized these drives (a 540 MB Decathlon drive and a 420 MB ST3491A)
>, and Falcon worked perfectly.

That's the way it's supposed to be.

>I wonder, how an IDE CD-ROM might function as IDE id 1... ;-) ?

I'm quite sure CDTOOL by Hard&Soft can handle this. Hard disk drivers don't
support CD-ROMs, of course.

Source record: 157356

Hi again everyone...

I have the following for sale... BRAND NEW

Suzy B's Atari Software Treasury

Suzy B 2-CD sets. Includes all sorts of PD and shareware. *All hand picked* from various sources.. the internet, BBSs and PD libraries. Full paragraph descriptions on each one, and a comprehensive index. Most programs run directly from the CD.

What's on it:
Games, Falcon software, WAVS, AVRs and MODs, Utilities, MiNT and MiNT files, Spectrum 512 files, Financial software, Atari Works templates, Software demos, Comms software, Childrens software, Databases, Picture Manipulation tools, Label creation software, DC software, 8-bit files, Printer drivers, Icons, Boot utilities, Screen savers, MIDI files, Pictures from NASA, HD backup software... and much more...

Price is only 45 Pounds, plus 2 Pounds postage and packing (within the UK.. overseas add an extra 1.50 pounds). The competition selling this same CD set is selling it for 50 Pounds plus postage.

I have 7 of these left, so please order soon to make sure you get a copy.

>
Keith Murchison (cb092@freenet.carleton.ca) had a few copies of GEM Draw,
which included the GEM interface for DOS. We installed it on my wife's
PC, so that when she asked me to move files, etc. for her, I could do it
in a sensible manner. Previous to that, XTree was our only handle on DOS
file management. How anybody would dare operate a DOS machine without one
or the other of these handles, is a complete mystery to me!

Keith may have some copies of GEM Draw left. GEM is better than WinDoze,
especially for an older smaller RAM machine. ('286 or '386)

Hi!

I seem to have a problem I can't fix (I think).. I own a Dynalink 14K4 modem
and it hangs about every 5 minutes (sort of buffer overflow I guess), making it
implossible to continue without resetting the modem. The Fax part works fine.

I used Fpatch1, 2, hsmod and friends, and still the same problem.
btw. it is connected to a Falcon. It is not the serial port, for I used to have
a 2400 connected to it, without problems.

Anyone?
Thx, Ludo

From: gufl0000@stud.uni-sb.de
Message-ID: <46hi0f$68c@hades.rz.uni-sb.de>
Source record: 157370

Hi everybody,

the new game I'm writing has got an ugly bug: My program needs to react to keyboard events but only if the key is really still pressed. Imagine I keep the key pressed. My application reacts to the event (it takes a little time) and after that it receives all the other keyboard events that have followed in the meantime and this behaviour confuses my cute little program quite a lot.

I have to find a way to clear the buffer with the keyboard events after my function is processed, so that the function is called only, in case the key is still pressed. Is there a "GEM-conform" way to do this?

I don't want to turn off the key repeat (which would definitely work). Neither do I want to ask for the state of the keyboard before processing my function, because another event could have slipped inbetween and in this case I want to keep the keyboard event stored.

Anybody got an idea?

Thanks!

Guido

Compo, Sys. Sol. etc. BUT...Hmmm. depends what you expect by "on the fly".
The machine will always re-boot when changing
resolutions.

971. more CAB questions

Newsgroup: comp.sys.atari.st
Date: 1995-10-24 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <814536704_OASIS_@phil4.demon.co.uk>
Source record: 157374

First off these aren't 'CAB/STiK doesn't work how do I...' questions.

I'm hoping that this article will be read by one of the people responsible for the development of CAB/STiK and the assocaited stuff.

here goes:

1)How long are we going to have to wait for forms to be useable in CAB, as far as I can see this stops us from being able to use search engines like Savy Search etc.

2)How long before CAB handles other HTML stuff like mail and FTP (possibly chaining to a seperate program).

3)Who is ressponsible for the above development ? Alexander Klaus, Tim Newsome or Steve Adams ????

4)I use a MegaSTE with CAB, is there a way I can listen to sound in HTML documents ??? I see that CAB supports external programs, is ther one that supports playing sound (from CAB) on and STE ???

5)Similary for JPEG pics ??? (nb. CAB crashed the other day when getting a jpeg, I presume the cause may be the lack of an external program.

6)What is the cause of the instability in CAB (the fact it can crash every now and again), is this down to CAB, the overlay or STiK - Nb. I'm not refering to a fault with my provider or dial scripts.

I hope this doesn't sound too picky or anything. I don't use netscape or any other web browser, so I am interested in seeing this one prosper. The above are some of the most crucial aspects, and I am interested in finding out how long they may take to appear.

Thanks for any answers

>
>If I buy a Gemulator, does that make me a damn pirate because I, too,
>use an Atari?
>

I've said it before, and I'll say it again,, Darek Mihoka is a bitter
little goofball, who doesn't even understand the most basic marketing ideas so
he reacts by blaming the market for his own failings.
I bought Quick ST 2, and it was a *great* product. Then he promised the
world for Version 3, and I bought that too, but it sucked, it was worse than
QST2 . aHis sales flopped because people like me told everyone what a
waste of time it was, unless serious upgrading happened. Is that the market's
fault? Then he passes the product on to the codeheads who claim that Warp 9 is
the most pirated piece of softwre on the face of the planet -- WHAT A LOAD OF
CRAP! Warp 9 wouldn't work with anything! It wouldn't work with Speedo GDOS,
it wouldn't work on the Falcon, it wouldn't work with That's Write (the
Codehead's solution? Buy their word processor too!) and it wouldn't, and for
all I know still doesn't, work with MultiTOS! Besides which, NVDI was far
superior in version 2.5, let alone what they've added to version 3! Imagine,
no bugs, no incompatibilities, an excellent GDOS, hey, this is almost looking
like a quality product... But somehow, people like Darek Mihoka can't get a
basic simple notion though their fat heads -- You can't sell crap unless
someone wants to buy crap, which is good because he's working for Microsoft
now.
Yeah, you're right Darek, we're all a bunch of pirates. That's great for
your public relations, isn't it? Why don't you just admit that you don't know
what you're talking about and stop blaming everybody else because you can't
sell crap. You are nothing but a crybaby.

Jon

: into memory instead.

No problem: Use TOSPatch to relocate your TOS image to an appropriate RAM address, apply additional patches if you want, that's all. There should be a TOS image loader included in the TOSPatch archive.

^???
Flopticals are just "normal" diskettes with additional optical
tracking information. So you can use 1MEG or or 2MEG diskettes in an
Floptical drive.
You cannot use Flopticals in a ZIP drive because the ZIP is a Bernoulli drive
(that means the heads don't have direct contact to the media surface).
: need a driver to tell your ST how to talk to it, and it's not looking like that's

Troy Carpenter (troyc@bnr.ca) wrote:
: I have found out that the Quantum Fireball does bus arbitration and the
^^^^^^^^^^^^^
That's simply what *every* SCSI drive does. If it doesn't work there are other reasons. I know of bugs in some older drives (e.g. LPS 170) having formware bugs concerning the synchronous negotiation mode. When the driver asks the drive for synchronous transfers the drive's firmware simply crashes. I don't know if this is fixed now.
Another point is disconnection/reconnection. Some drives try to disconnect even at normal R/W operations which is nonsense for harddrives (it slows down my drive from 1.2MEG/s to 650KB/s!).
: TT's SCSI port does not. Therefore, I need a HD driver that handles
: bus arbitration, and the driver that has been recommended to me is
: HDDriver.

I recommend to simply try different drivers if you can get hold of but I think even the original driver should work.

: sites--but the archiving/compression software didn't function. (It was
: supposed to be a self-extracting file--but didn't do anything.) Does
: anyone have a working version of an LHA or LH-whatever utility?

Hi David,
if you got some .LZH or .LHA files these are normally not
self-extracting. If you have a disk monitor you may take a look into the
files. There will be an entry like -lhx- (x may be 4, 5 or so...) at the
beginning of the file. If the method is -lh5- you need quite actual
compression utilities to decompress, e.g. LHA3.01 or newer.
If your compressor complains about an "unknown compression method" it is
too old.
If your tool complains about "CRC error"s or tells you the archive is damaged
you have other problems (i.e. accidentially downloaded the file as ASCII).

: the Quantum.

: Does anyone have this drive? How did you get it to work? Did I just get
: a bad drive, or is there some problem with it? That would be too bad,
: especially since the price dropped to $299.

Do you have a host adaptor supporting parity? If not: The newer Quantum drives can be configured by software (especially the parity, but also things like the SCSI ID). So you need an adaptor supporting parity temporarily and some software for configuring the drive (i.e. SCSI tools - there is also a Quantum fix available from ICD). After reconfiguring the drive it should work with your adaptor. Be careful never to reconfigure it to parity since you then will have to repeat the procedure again...

982. Beginner Alert!

Newsgroup: comp.sys.atari.st
Date: 1995-10-25 00:00:00 UTC
From: Somebody Else <who@uea.ac.uk>
Message-ID: <46lrb9$sih@cpca3.uea.ac.uk>
Source record: 157262
Cross-posted to: alt.steinberg.cubase,comp.sys.atari.st

I'm wondering if anybody can help me? I'm considering a simple AtariST/Cubase setup for home music demos. I've used this configuration in an 8-track studio with good results but I'm very limited with my own options - i.e. I'm pretty broke.

I'll be getting a secondhand Atari, the Cubase s/w and I've already got suitable monitoring and synth. The problem is that I'll be needing tape audio too and all I've got if a very old Fostex 4-track. Now then, I can't afford a Cubase Audio setup, digital recording, 8-track etc., so I'm going to be very limited initially.

Now this is where you lot can help me out:

1. What ST do you recommend? They're all pretty cheap second hand. I don't mind fiddling about with one 3.5 drive, so should it be 520 or 1040?

2. I'm soon going to be fed up with arranging on Cubase and then dumping onto the Fostex for the analogue stuff, so I'll be hoping to sync the 2 together as soon as I can afford it. Recommendations on syncing please.... I've used SMPTE a little but how expensive in the clock/generator? What's a sync box? How much is that? Help.....

3. What ancillaries will I need, MIDI cables etc.? Will I have to get a MIDI interface for the ST to connect with the synth? Does the ST already come with one?

Any comments more than welcome. Please remember that I'm new to all of this and I only want to initially set up VERY CHEAPLY. So all the expensive gear can be forgotten about.

PLEASE POST REPLIES AND DON'T EMAIL - I've only got newsgroup access. Many thanks in advance - I'm looking forward to all this..

Stevie.

Don't be a prat...

The Key for Freeze Dried Terminal was made PD and distributed throughout the BBS world about 2 years ago when the author gave up on the Atari scene altogether.

It has also been included in a couple of magazine disks...recently ST Format.

Source record: 157376

Maybe STonX should ask Atari if they would sell a per user/per system image license for about $40?? They would make a few bucks and everybody would be legal.

Darek really hasn't any reason to be hot on the competition thing, since Gemulator only runs on Win95.

Oh, wait a minute....Darek told me that he develops on NT at home. And since the LAST TIME I TALKED TO HIM FACE-TO-FACE has said that he had to use a copy of a TOS image because he hadn't finished an NT device driver--well I guess there's a good reason for it.

I think somebody should talk with Atari about their legal position about TOS chips and copying them....

BTW, not sour grapes on my part, cause I'm the one who wants to use a Gemulator.

GNU C is one. Pure-C is another. The former is free, the latter is commerical. Both are excellent. Top marks for speed go to Pure-C which has got to be the fastest Atari C compiler to be had, making Lattice and GNU look very slow. On the other hand, it's integer size is sixteen bits, which makes porting software a touch awkward at times. Both are fully ANSI compliant.

: -Hutch-

I have actually seen one, it's got dual drives built in and looks kinda
IBM XT ish with an atari 800 style case (maybe 1200 style?) but in any
case it had the vented corner edges. It is in the possession of an Atari
collector named Chris here in Salt Lake. Atari started at the University
of Utah where some engineering students built a kind of 2600 level
Virtual light Machine. (he has one of these too!) he bought his 1450xld
from Atari corp. out of the stockpile of stuff, he must know someone eh?
Anyway he has every Atari known to human kind except a TT or Falcon. He
did a clock buffer MOD on my falcon and it was almost a religious
experience for him to open the case and look at the board etc. He found
it to be almost a work of art. He also adores the 800's tough quality
build and extruded aluminum shielding. I have really come to appreciate
this piece of Atari artwork (Falcon) after looking at it from his point
of view.

996. Help w/Oasis & dynamic ip & CSLIP

Newsgroup: comp.sys.atari.st
Date: 1995-10-25 00:00:00 UTC
From: jprice@ivory.trentu.ca
Message-ID: <DH08AE.Hvy@blaze.trentu.ca>
Source record: 157387

I'm trying to connect via CSLIP to a provider using dynamic ip. So far no luck. I've tried:

1) Entering 0.0.0.0 as ip address in the setup.

2) Logging on w/Uniterm from the Toolbox, getting the current ip address
2) Logging on w/Uniterm from the Toolbox, getting the current ip address
returning to Oasis and entering "ip adrr x.x.x.x" (whatever address I'm given) at the "NET>" prompt.

My provider claims that their setup will negotiate w/my software and disable the compression if necessary. Does this work for Oasis?

Any and all hints welcome. BTW, I'm using a 4Meg. STe, 14.4 SupraExpress, Syquest 44 Meg.

Thanks.

Lonnie Webb <lwebb@fastlane.net> writes:
>Maybe STonX should ask Atari if they would sell a per user/per
>system image license for about $40?? They would make a few bucks and
>everybody would be legal.

That makes little sense - I don't see why someone else should make money
off a Freeware program, especially if they haven't contributed to it.
The best solution would be an official free license from Atari to use
and distribute TOS 2.06 with STonX (which we can't do at the moment), since
they have given up computers anyway. A similar thing happened when Darek
got permission to distribute the 8-bit OS with XFormer. Another solution
would be to ask the people who developed KAOS for a free license (I don't
know about the legal status of KAOS though - I think I heard that it was
declared illegal), and adapt STonX to work with it (if it doesn't already).

I was a die hard Atari fan in the past and collected everything Atari. I have 6 issues of a Comic book that was put out in 1984 called Atari Force. I have copies # 4, 6 thru 9, & 12. They are all in good condition and can add fun to your Atari life if you are a die hard Atari fan. I since moved to a Mac and no longer want the comics. I am accepting offers if someone would like to buy them for his/her collection.

Hi. could anyone possibly suggest a cheap, low-end, starter computer in the Atari ST line? I own a couple PeeCees and an Amiga, and am interested in getting into the Atari line. What's a generally good price on a lower-end machine like a 520ST or a 1040ST, and which computer is the best "bang-for-the-buck"? Anyone out there got a cheap Atari ST package (computer, single floppy, fairly recent OS version) for sale? Any info (a FAQ, mebbe?) or offers would be appreciated :).

Thanks for the information. Now I know to look for no-parity
drives which I didn't know before. I was looking through the paper and
saw ide controller boards that appeared to be scsi devices. Do you know
if it is possible to use an ide drive plugged into an ide controller that
is plugged into a scsi controller or is that just to large a stretch for
the imagination?

:
: I'm sure you get a warm fuzzy feeling inside knowing that you've just
: pirated your TOS ROMs and have the balls to brag about it on the
: Internet. Don't be surprised if some people come knocking on your door
: soon.
:
: Unfortunately the makers of legitimate Atari ST emulators (Gemulator,
: Magic Mac, Janus, etc) don't have the luxury of selling products that
: use pirated TOS ROMs. I'm sure we'd all like to, but because we don't
: care to have lawsuits on hands, we use either legitimate TOS ROMs or as
: in the case of Magic Mac, write a new OS.
:
: So all I have to say is it's rather foolish of you to go on the Internet
: and admit to being a pirate. Unfortunately the makers of STonX don't
: appear to have any regard for copyright laws either.
:
: I've said it before, and I'll say it again, Atari users are all a bunch
: of damn pirates.

What are laws made for? For serving people? Or for something else?
How silly should we really be? Who does this kind of "piracy" _really_
hurt? I'm getting tired of people who read those lawbooks like they
read bible.

It's the spirit, I believe (of the law) - not the exact words.

No, I don't think this person was a pirate - no matter, how many lawyers
might sue him just because they can.

Mostly honesty is honorable and good, but sometimes it is stupid, I
think. Things are never black and white - and copying TOS for some
purpose doesn't make someone a pirate. Writing stuff like this doesn't
make me a pirate, either.

It's funny, you know - the REAL pirates I know all come from the PC-
family. Those heros who boast they NEVER have purchased any single one
piece of software... It's SO easy on the PC-side.....
We Atari-users sometimes have to work hard to find soft- or hardware.
Sometimes it's impossible to find something necessary legally. What do

people do then? Change platform? On PC-side they could copy their MS Words, Windows programs, games, everything, easily - and nobody would care. Why is it US who are the "damn pirates"?

Should Atarians give up their machines if they don't find a legal TOS - and join the paradise of pirates: DOS-world?

Really: what would you want people to do? You have to have software for your computer, don't you? The machine itself _is_ useless!

I think we're even too honest sometimes - and that might hurt us sometimes...

I don't like these kinds of "damn pirates" -messages, because they simply are NOT true!

Greetings,
Tommi (not a pirate - but sometimes life on PC-side would be easier..)

Well, MagiC is a good example of an improved re-written TOS (MultiTOS).

By the way, I've have been informed that the long awaited MagiC for Falcon, will be a MagiC V.4., which supports all Falcon-hardware specifics, but also runs on STe and TT.

MagiC v.4. has an improved built-in desktop, so that desktops like EASE shouldn't be neccessary.

Keep Cool and Flying...

My ST died. A stable operating replacement 520 or 1040ST is
required. Would be nice (but not necessary) list:
1) socketed 68000 processor
2) socketed memory (for a SIMM board update)
3) more than 1 meg memory
4) TOS 1.4 or higher.

1018. Re: GEM for PC's?

Newsgroup: comp.sys.atari.st
Date: 1995-10-26 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DH16s8.Fyr@freenet.carleton.ca>
Source record: 157266

Elmar Vogt writes:

Howdy!

I dimly remember there once was a PC produced by Schneider, which
would be shipped with GEM installed.
Does anybody know whether this was an IBM-compatible, and whether there
were GEM versions for PC's ever? Is there still any support for it?

Just wondering, since it might be a way to give the ST a new live-
with its GEM/TOS controlling a PC-zombie... :-)

Here is a copy of the post I put on this newsgroup some time ago. It
explains more about Gem for the PC.

Quote:

Subject: Give your IBM the Look and Feel of an Atari ST - $45

In reply to my previous post of this same title, Steve
Hollman has written

>Quote:
Keith N. Murchison (cb092@FreeNet.Carleton.CA) wrote:
: I have several complete copies of GEM version 3 (the last release
: for IBM): With GEM installed, you IBM suddenly takes-on the personality
: of an Atari ST, but runs all of your favorite DOS programs from
: a hassle-free desktop environment (one familiar to any ST Atari
: user).
And if you are fortunate enough to aquire a copy of GEM 1.x, you will
find that the desktop.app from the old pre-apple-lawsuit version of GEM
will replace the desktop.app from GEM 3 and run quite happily over the
newer OS giving you compatibility with newer GEM software and a desktop
with _exactly_ the "look and feel" of your ST.
And this really does make an excellent substitute for (cough) File Finder.

Unquote:

Steve has his facts right, version 1.x is even truer to the ST model,
in that it features the Trash can, and moveable, scaleable windows,
while Version3's desktop features to fixed ST type Windows (with ST
type ICONs, Commonmenus, common drag and drop features, etc.).
Unfortunately, versions 1.X don't run at quite as high a screen
resolution when displayed on a VGA or SVGA monitor. Spefically You get
640X350x16. This difference doesn't effect any DOS applications you
launch from the desktop. I also have two copies of GEM 1.X for sale
at the same price ($45). These packages also include GEM draw for

IBM and several IBM GEM desk accessories. Whether you pick GEM 3.0
or 1.2 you are way ahead relative to other user interfaces available
for your PC (including the DOS prompt, WINDOZE and DOSSHELL - cough)

1020. TOS 2.06 upgrade problems

Newsgroup: comp.sys.atari.st
Date: 1995-10-26 00:00:00 UTC
From: zrollinso@cuppa.curtin.edu.au
Message-ID: <46n1hm$831@info.curtin.edu.au>
Source record: 157268
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

For the last two weeks I have been attempting to upgrade my 520 STe (4meg) to TOS 2.06 (used to be 1.4). The upgrade came with no documentation or instructions whatsoever.

Some truely excellent netters have assisted me so far, but now I have run into a proverbial brick wall.

To start with, the machine wouldn't even boot. I had to move jumpers w102 and w104 to cater for the new ROMs (4 pins bigger than the old ones). The chip number on the new ROMs is 27C010A.

Now, the machine boots, and the RAM diagnostics in the boot sequence checks out ok.

After booting, if I try to run a .PRG file (doesn't matter which) the machine just hangs. The cursor changes to the busy bee and stays that way.

If I run .TTP applications, the dialog box pops up and accepts parameters and then hangs.

Accesories seem to run just fine from the pull down window.

I can copy and rename files without a problem.

Has anybody seen/heard of this situation before?

I did hear today that 2.06 can't read old desktop.inf files but uses newdesk.inf and I was wondering if this may have something to do with it - but I would have thought that the system would just ignore the old desktop.inf.

Is there something that I have missed? I checked the electrical connection of the two jumpers (w102 and w104) again last night and it appears to be good. I've tried undoing the upgrade and reverting back to TOS 1.4 and it works ok - but that kind of negates the idea of upgrading.

Any ideas?

:
: Any ideas?

Well, since the computer boots with the 2.06 ROMs I guess there's nothing wrong
with your installation. It could be that the ROMs are faulty.

z> compatible with SCSI 1? Can I plug a SCSI 2 drive into my host adapter
z> card without some other modification? Do I have to get a SCSI 1
z> mechanism? Thanks for your help.

The basic answer is yes. My SCSI 2 Fujitsu drive has a jumper setting to
convert it to SCSI 1 anyway, but it doesn't need to be set that way for my
Mega STe. More of a concern is parity, but again my Fujitsu has a jumper
setting for that too. With the ICD utilities the parity setting can be
changed by software even if there isn't a jumper to do it.

No. There is no driver and I guess there'll never be. It's easy to connect
drives to the DMA bus using a DMA host adapter. IMHO parallel ZIP drives
connected to an Atari are nonsense.

1026. TT media player SLOOOOW

Newsgroup: comp.sys.atari.st
Date: 1995-10-26 00:00:00 UTC
From: dave <dave@mbha.demon.co.uk>
Message-ID: <814697638snz@mbha.demon.co.uk>
Source record: 157274

Can anyone out there tell me why my TT is SOOOOOO SLOOOOOOW when playing MPG, MOV, or AVI files?

I had (perhaps somewhat smugly) always maintained that my TT was better in all respects (except possibly in the abundance and quality of software) from the crummy DX2/66 I use at work. I have to say however that the combination of PC and windows media players do a much better job than the combination of TT and media players I use at home (no offence Deiter and Griff!).

I suspect the data throughput might be the cause but I assumed (again somewhat smugly) that the TT bus running at what I thought was the system clock speed of 32mhz was far superior to the PC bus (16 bit? 16mhz?).

I am not a techie, so can someone explain why I grow old and grey waiting for movie files to play?

All help gratefully received...

> What does the rest of the group think of STonX? Should we stop developing it?

Nononono. Why should you do that ?

I mean, as long as you don`t deliver TOS 2.06 image with STonX, it can't be your problem. Everybody who has a machine with TOS 2.06, has the right to use TOS on any machine for oneself as long as others won't get a copy of he/she's TOS.

As far as I know, TOS goes under the same law as other software.

Keep Cool and Flying....

From: ggeens@elis.rug.ac.be
Message-ID: <46nlit$gcu@infoserv.rug.ac.be>
Source record: 157277

A year ago, I bought an Atari Falcon with 4MB memory, HD: 65MB, TOS 4.04.
I use an old SM124 (I bought it together with my first ST).
At first, there were no problems with MultiTOS, altough I didn't use it
often.
Recently, I tried to run MultiTOS again (after a long time). It didn't work!
In between, I've installed a lot of other software, so I suspected some
incompatibility problem.
I used superboot to switch off all accessories and AUTO folder programs.
Still didn't work!
A virus? Reinstalled from the original disk (that was write-protected), still
didn't work! Besides, the only other program I've got problems with is Nethack
(GEM version).
Nethack isn't intended to be run on a monochrome monitor, so maybe that's
the problem.
Has anyone else got a similar problem?

I think it is true that GEM was origianlly developed for the PC. I certainly have very early documentation on GEM that I still use that was for the PC.

The interface is identical to our beloved GEM, so it is a pity it never took off on the PC. Software ports would have been so easy!

Why ? A 286 is very slow.

Keep Cool and Flying...

Randell Spreadborogh (zap@eskimo.com) wrote:
: Can I plug a scsi2 hard drive into my icd host adapter without any
: modification? What is the difference between scsi1 and scsi2? Thanks for the
: info!

Yes if it's the ICD Link 2 or Adscsi+ or similar.
A scsi 1 controller will run a scsi 1 hd.
A scsi 2 controller will run a scsi 1 and a scsi 2 hd.

I don't know all the differences between them but thw scsi 2 command set
is different and scsi 2 HDs are much faster :-)

Good luck.

Steinberg are understandably cautious about giving out manuals because of
the large numbers of hacked Cubase programs about. Assuming that your
version of Cubase is genuine, ie with a dongle, then it is very strange
that the guy you purchased it from did not give you the manual.. a quite
important bit to have. I'd take it up with him.. he surely must have it.

Regards,

Richard.

I recommend a 1040STfm, SC1224 monitor. This gives you the option of
outputting to tv. 1Meg of RAM will run a great percentage of the programs,
if you're willing to forego ACCessories and AUTO utilities. You might luck
out and find one with TOS 1.4, which has some advantages over the original
TOS 1.2. A logical first upgrade path would be additional RAM. Also, a hard
drive makes computing much more convenient. You at least owe it to
yourself to get a second floppy drive. A MIDI keyboard synthesizer opens
another entire realm of creative and educational possibilities.
And of course, you'll want a printer. A 24pin Epson-compatible is a good
price/value item these days. Works with nearly any Atari software, gives
good quality print, and can be bought at a reasonable price.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros.
At present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy,
Mega STe, TT, and Falcon. There are also emulators for the Apple Macintosh
and IBM PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.
```

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS: 93.06.11
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC, .ZIP and .LZH are archive files.
They are binary files which may contain one or more other files in a
compressed format. Archive files usually take up less disk space, and for
this reason have become quite popular for transferring large files
via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ZIP Use UNZIP.TTP or STZIP.PRG
ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no
arguments.
* If in doubt, to extract a file, copy the archiver to the directory that
the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the
archiver by just changing the current directory to where the file is. See
TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost
certainly answer all your questions. Documentation is usually included
in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in
the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive
subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want
speed, better compression, and don't care about
archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation.
UnArc using lharc.ttp

stzip22.lzh - STZip, with GUI interface

unzip41.lzh - Old version of unzip

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:MSA: 93.06.11
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work,
cherborth@semprini.tdkcs.waterloo.on.ca at home,
C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

There is yet another MSA archiver now, called MSA II, by Phillip Lang.

:CLI: ??.??.??
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR: ??.??.??
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

```
CRC error.....................-4
Bad request...................-5
Seek error....................-6

```

```
:GDOS: 93.05.05
What is GDOS, and where can I get it?
====================================
```

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called SpeedoGDOS, which should be available commercially from Atari. It is currently included with AtariWorks, and some Falcon packages. SpeedoGDOS uses scaleable fonts - you do not need to create a font file for every point size. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within SpeedoGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie).
The demo program appears to have the GDOS system and font files.

In the UK The ST Club (2 Broadway, Nottingham, UK NG1 1PS. Tel 0602 410241, Fax 0602 241515) is a licensed GDOS distrubutor:

Catalogue No's:
GDOS-A Driver + Fonts 9-pin
GDOS-B Driver + Fonts 24-pin
GDOS-C Installed system for Opus (9 pin)
GDOS-D Opus 24-pin
GDOS-E FontGDOS + drivers
GDOS-F 300dpi printer fonts

Disks 2.95 pounds each.

:GNU: 93.06.11
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.4.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.4.2 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System

SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM: ??.??.??
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG

U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG: 93.10.18
Public Domain/Shareware languages...
==========
(This section is getting an overhaul, but I don't have the time to finish
the overhaul right now... Sorry, check back next month.)

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassemblers: a68, turboass,
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)

Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX: ??.??.??
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to

upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT: ??.??.??
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar package (it's not part of the standard MiNT distribution) modelled after TOSWIN and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN: 93.03.01
Is there a version of XWindows for the ST?
==

There actually is a port of XWindows to the ST now, although it is pricey. Here's the (slightly hacked up) announcement for it:

X/TOS/window/server and X/TOS/window/server/color

Vendor:
X/software Michael Gehret
X/TOS division
Marktstrasse 8
W-8944 Groenenbach
Germany

color 320x480x8
Ethernet Card:
Atari Card (Mega or VME bus)
Riebl/Wacker (Mega or VME bus)
Biodata BioNet 100 II (DMA port or VME bus)
Network Software:
Atari/Riebl/Wacker ANS TCP/IP
Biodata TCP/IP
Disk Space:
none (two floppy disks, may load fonts from second disk or font
server)
Features:
full X11 Release 5 implementation
Shape, Multi-Buffering, MIT-SUNDRY-NONSTANDARD extensions
PEX extension optional
support of font server protocol
support of X Display Manager Protocol
access control support
compatible to OSF/Motif and OpenLook
high performance (more than 32,000 Xstones on TT)
fast cursor tracking
backing store and save unders support
size of virtual screen limited by memory only, automatic panning
X/TOS/window/server/color supports all video modes at the same time,
including dynamic visuals
loadable key maps (xmodmap format), full support for European
keyboard layouts
3-button mouse emulation with Atari 2-button mouse
may run parallel to GEM (switching with hot key), configurable multi
tasking priorities
about 50 fonts supplied

:DEMOS: ??.??.??
Why won't demo x run on my machine?

==========

90% of the time, if a demo does not run on your American ST, you probably
need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from
atari.archive to allow this.

:PAINT: ??.??.??
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD: 93.06.11
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ZIP, .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL: ??.??.??
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It
contains a multitude of Atari ST PD and shareware programs. If you don't
have access via FTP you can obtain many of the files via e-mail.
You should first obtain a help file by mailing a message to
atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before
you ask questions, and then send any you may have to
jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to

weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files.
Subscriptions to INFO-A16 are also available on this server.
INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP: 93.05.05
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota

is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there
are other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

src.doc.ic.ac.uk

This site has a mirror of atari.archive.umich.edu in /computing/systems/
atari/umich.

:TEX: ??.??.??
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files
(showdvi)
If you want to print locally, you'll need printer font files
(dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail
request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros.
At present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy,
Mega STe, TT, and Falcon. There are also emulators for the Apple Macintosh
and IBM PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:MODELS: 93.01.30
All the models in the ST line
==========

This is a pretty complete list of all the ST/TT models and their main features. If you have any additions/correction, of course, send them to me.

Feature key:
CPU's:
8 8 MHz 68000
16 16 MHz 68000
16/3 16 MHz 68030
32/3 32 MHz 68030

RAM:
/1 128kB
/5 512kB
1 1MB
2 2MB
4 4MB
S SIMM slots for expansion

Built-in:
F Floppy
M TV modulator

Extra:
AV 8 bit digital stereo audio, 4096 colors, hardware scrolling, analog joystick ports
MB MegaBus processor-direct bus slots
6U 6U VME bus slots, second serial port
FC Motorola 56000 DSP, 16 bit stereo audio, much enhanced video

TOS:
Highest built-in TOS

Models:
Name CPU RAM TOS B.I. Extra Comment

Falcon 16/030 S 4.?? F AV,FC Many enhancements!

:FALCON: ??.??.??
What are the specs on the Falcon?
==========

Here's some stuff I culled from the (reposted) Delphi conference with Sam Tramiel.

--- Start Quoted material ---
Here's the specs on the Atari Falcon 030:

CPU: Motorola 68030 running at 16 Mhz
32-bit Bus
Optional 68881 or 68882 FPU
RAM: 1,4, or 14 megs
Standard Atari Cartridge Port
Motorola 56001 DSP chip

Expansion Bus:

Internal direct processor slot for 386SX PC emulation, or other coprocessor

Graphics:

Super VGA graphics: 640x480 with 256 colors
True color 16 bit mode allowing a display of up to 65,536 colors
Accepts external video sync signal to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan on TV's and ST Color monitors
262,144 possible colors
hardware-assisted horizontal fine scrolling
BLiTTER graphics co-processor

Sound features:

Eight 16 bit audio DMA record and playback channels
Stereo 16 bit digital DMA input
Stereo 16 bit DMA audio output
SDMA sound/DMA Coprocessor

Standard Ports

SCSI II port with DMA
High speed LocalTalk compatible LAN
Connector for analog RGB color (ST or VGA) or composite video
RS232C serial port
Bidirectional parallel port
MIDI IN/MIDI OUT
Stereo microphone input, miniature stereo plug
Stereo audio out, miniature stereo plug
Two joystick connectors
Two enhanced digital/analog controller/light pen connectors

Data Storage

1.44 Mbyte floppy disk drive
Optional internal IDE Hard Disk

System software

Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)
Inter process communication
NewDesk desktop and eXtensible control panel
Multiple window user interface; number of windows limited
only by memory or software in use.
--- End Quoted Material ---

:ACCEL: ??.??.??
Hardware Accelerators
=====================
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM
slot 68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:TAPE: 93.08.11
Can I use a SCSI tape drive?
============================

Yes, just about any SCSI tape drive should be useable on the ST line. (Of
course, if your computer doesn't already have a SCSI port, you'll need a
SCSI host adapter.) There are at least two freeware/shareware programs
that can help you back up your HD to SCSI tape: TapeBIOS and GEMAR
(a German GEM ARchiver)

:DRIVES: ??.??.??
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins
IDC connector, and usually say SCSI hard drive or Mac drive.
(Any Mac except Mac128, Mac512, FatMac has SCSI built in, so a drive
that works with Mac usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar
cards availible. Adaptec has stopped production for quite sometime
so look for these in used/liquidation place.
(usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:

3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house
the adapter and hard drive. IBM case is very easy to get and has a lot
of space for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts
each, make sure your power supply has more than the drives need. Again
if you use IBM case, the 150 watts power supply for that type case can
drive at least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power
supply. SCSI cable from host adapter to SCSI drive or adapter
(for MFM/RLL), it's 50pins IDC female connector on each end
with 50 conductor cable. Should be availible at place you
get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should
be available at the place you get the drive).

Now, connect them all together. Before power up, check the connection
again. And check the jumper setting on the drive (consult the drive's
manual). If you are using more than one drive with the system, make sure
only the last drive has the terminator (either a DIP or a signle inline
package of resistor, which usually is socketed and close to the SCSI
connector on the drive circle board. Remove the terminator from other

drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5
from ftp sites.

:FLOPPY: 93.08.11
Can I use 1.44 meg floppy disks and Flopticals?
==========

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which
offers a $199 kit (including floppy) to install and use the drive.

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from
the desktop.

Floptical drives (floppys that use optical tracking to get 21MB on a 3.5"
disk) can also be used through a SCSI port. ICD's newer host adapter
software (the 'PRO' version) will handle them.

:GRAPHIC: ??.??.??
How can I enjoy enhanced graphics on my ST?
==========

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass
at listing some of them. The information is based on postings by
Ben Gilbert and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different
graphics boards available, from hobbyist to professional, from CAD
to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Here's a few more cards, available from OverScan GbR, Saentisstrasse 166,
1000 Berlin 48, West Germany, ++49 30 721 94 66, ++49 30 721 56 92 (FAX),
++49 30 727 05 6 (Mailbox, language: German)

Autoswitch OverScan for the ST (NO STE compatibility) is DM 129.--, you
don't have to buy a new monitor. The maximum resolution on a
SM 124 is variable, but in most cases at about 732*480.
AutoSwitch OverScan TT is a VME board. It's about 249.-- DM, you also can
use your old monitor, but it only works in the TTs five color
modes (3 ST-compatible modes, 2 TT-modes). Resolutions are
variable, ask OverScan about the values for your monitor.

Falcon ScreenBlaster blows up your Falcons resolution to a maximum of nearly
900*600 on SVGA-monitors. It'll be shipping as soon as Falcon030s
become available, and the pricing will be near 150.-- DM.

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:KEY: 93.09.02
A few keyboard questions
========================

Here's how to connect a MegaST-keyboard to a 1040ST:
It's taken from the "ST-Computer" October '90 ('Quick-Tips')

Picture 1

Mega ST-Keyboard cable
(seen from outside)

It's no problem to connect * 1
the MegaST keyboard to the _____________ o
smaller computers 520St and ___| | * 3
1040ST. To do that, you only | 6 * | * 4
have to get a 6-pin western | 5 * | * 5
connector plug to be connec- | 4 * | * 6
ted to the keyboard. (available | 3 * | * 7
in Electronic shops) After that | 2 * | * 8
four cables must be connected | 1 * |
with the 'Pfostereihe' (the |___ | 1040ST
plug inside the 1040ST) where |____________| Keyboard-Plug
normally the dazzy original-keyboard
is plugged in. The exact connection Picture 3
is shown on picture 2 and 3

Eickmann Computer, Franktfurt

* * * * * * * * * * * * * * * o *

1 <--| 1 <--|
****
And now for No.2
****
If you remove the keyboard from the Mega ST and switch on the computer,
the computer won't boot up and send you a series of 'Alert-Beeps'.
If YOU want to let your Mega ST run without a keyboard (FAX-Server a.s.o.)
simply connect a restistor to the keyboard-plug in the Meg and at once
there's silence and he'll do his job!
(Freely translated from Eickmann-Computer by me)

6 * 10kj resistor
5 * _____
4 *----|_____|--
3 * |
2 *-------------+
1 *-------------|

Mega ST keyboard-plug
(inside-view)
****
And here's another one: This one's about the Hardcopy-function of the ST's
****
Do you hate it - after pressing <Alternate>+<Help> the same time - when
you don't have a printer connected to the parallel port of your ST and
must wait a long time to work again because of the long break taking the
computer to realize that there's no printer connected?
Well, do this and forget about it:

connect the following pins of the printer port of your computer (better:
create a Sub-D 25pin-male-plug an connect the pins on the soldering side):

pin 13 connected to 14 and 15 (all across the plug)
pin 1 connected to 10
pin 23 connected to 11 and 12
****

:JOY: ??.??.??
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM: ??.??.??
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

You will probably need a serial port patch program to use high speed modems on your ST; most versions of TOS have a bug in CTS/RTS handling.

:MONITOR: ??.??.??
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than

a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM: ??.??.??
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot.
The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE: ??.??.??
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases.

The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommended to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best. It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop

as well(don't try to run the ST, IBM binary. It's only for file transfer).
Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will
not run with it.

:UPGRADE: ??.??.??
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want
to do in the future. Be aware that there are a large number of
modifications one can perform on the venerable 1040ST, and that newer
machines are coming down in cost so much that to obtain a certain feature
it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe
machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an
upgrade. TOS 1.4 has been around for at least 2 years now, and is -much-
faster (and safer) for those using hard drives. TOS 2.06 is available
as a hardware upgrade to ST and MegaST machines for about $150 from
CodeHead

>Does anybody know whether this was an IBM-compatible, and whether there
>were GEM versions for PC's ever? Is there still any support for it?

ISTR that Digital Research Inc. also wrote GEM for PC, as well as the ST.
In the early stages though Apple threatened or actually did take DRI to
court over a breach of copyright, and so the PC version was never
developed any further. Apple seemingly forgot about the ST version :-)

In the UK in the late '80s Amstrad PC's were distributed with GEM
installed.

>trademarks lately. Yes, it is illegal. You don't own the TOS in the ROMs.
>You use it under implicit licence. hat's why the copyright notices are
>there.

Could you elaborate on that? What kind of 'use' is covered by this 'implicit
license'? In fact, I doubt that an 'implicit license' can be enforced by law,
since no-one tells you the conditions of the license when you go into a shop
and buy the TOS ROMs in a plastic bag. If you are correct, then everyone
who has ever used WINX or similar programs, or patched their TOS, have done
so illegally. That's a bit strange, isn't it?

-nino
PS. Besides, in this part of the world, you own something if you buy it -
you can do whatever you want with a piece of software, as long as you don't
give it away.

I've never heard of this Falcon FX card, I guess it's time to give Gasteiner another call. The last time I made enquiries along this line with them, there were all sorts of Falcon accelerators just around the corner, but none that actually materialised.

I'd be interested in what sort of performance boost you get out of the Mighty Sonic if you've got time for a posting and a copy of GemBench handy?

TIA,

Shaun

Source record: 157295

Also, to reflect on the history a bit, Apple Company was started as a result ideas Steve Jobs & WOnziak got when touring through DRI and Xerox. GEM was originally developed as the intended OS replacement for all future computers as seen by DRI.

They never got the financing available to push it.

Jobs & Wozniak devised the Apple Lisa (then Macintosh) patterning the visula object methods (gui) after what they saw from GEM.

In later years, when GEM started gaining more PC ground, Apple then sued DRI to prevent others from using Apple's look and feel. DRI did not have the funds to fight and relinquished hold on GEM. Starting at version 3 or 4 of GEM, it was rewritten to escape the claims of Apple.

Since then, Apple has hounded other platform developers over the look and feel issue. THey sued Hewlet Packard and someone else over two different OS's that those companies developed. The court took quite awhile before ending this suit to anyone other than Apple's favor.

No one has ever touched Atari over the GEM code largely because of the prior purchase agreements between Bushnell, Time Warner and DRI/Xerox.. in addition to the fact that the OS was burned into PROMs.

There you have it, as best as I can recall it.

Maybe it's because of the newly appeared PlayStation from SONY.
I mean, the marketing for the PlayStation is very aggressive, compared to
Atari's marketing.
And by the way, the avaiable titles for the PlayStation looks quite impressive.

Atari need to release some major good titles for the Jaguar to keep people
interested.

It's just my teory....

1049. Re: STonX and Atari ST Emulators

Newsgroup: comp.sys.atari.st
Date: 1995-10-26 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <46ofo1$bqa@epsilon.qmw.ac.uk>
Source record: 157297

On mdg@ukc.ac.uk, M.D.Griffiths (mdg@ukc.ac.uk) typed away:
: What does the rest of the group think of STonX? Should we stop developing it?

Definitely not. Carry on developing it. Nino and you are doing a good
job there.

I really don't understand Darek's comments. Maybe what he was refering
to was the amount of pleas people are putting on the group as regards
copies of the TOS image. I don't give out TOS images as I think that
is wrong. I have TOS 2.06 at home... I payed for it, so i don't see
any problem with me taking an image of it for my own personal
use.. whether to use with STonX or just to patch it and burn into an
Eprom for myself.

I am not too sure on the legal situation here, but Atari themselves
don't seem to want to have anything to do with the ST... they are only
interested in the Jaguar.. for eg, who do I talk about the computer
line to at Atari UK? Certainly not Darryl Still.. he is the Jag
person... there is no computer person there.. i think.

I did once talk to a commercial reseller/developer in the Atari market
about buying EPROMS to burn a patched TOS 2.06 into.. TOS 2.06 which I
payed for.. and he said that it was illegal to do so. The only way i
could legally patch and burn the TOS would be to burn it back into my
original TOS EPROM.

The copyright does still stay with Atari, of course, but then I don't
see why I can's use something I bought in the way that i want!

Go figure..

Regards
Danny

From: jpb3@ukc.ac.uk
Message-ID: <13447@gos.ukc.ac.uk>
Source record: 157299

Has anyone by any chance got a nice set of Medium rez Thing icons, i.e.
an extension on the limited set of 16x32(I think?) that came with the latest
version of Thing.

I've made some of my own, but well, they're not really very impressive.
If any thinks that they may want them of course, I could mail it to them, or
(admittedly in the wrong place) post the uuencoded file here.

At the moment I'm using Neodesk 3, basically because Neodesk has a
quality icon editor, whereas the icon editor for Thing is just a joke.

I've been having to use (horror of horrors) WERCS, to try and edit the
Thing icon file. To say the least, WERCS isn't very good at what I'm using
it for. If only I had Interface. :)

If you do have some nice Med Rez Thing icons, just send the file straight
to me uuencoded...

Thanks in advance.

John.

: At first, there were no problems with MultiTOS, altough I didn't use it
: often.
: Recently, I tried to run MultiTOS again (after a long time). It didn't work!
: In between, I've installed a lot of other software, so I suspected some
: incompatibility problem.
: I used superboot to switch off all accessories and AUTO folder programs.
: Still didn't work!
: A virus? Reinstalled from the original disk (that was write-protected), still
: didn't work! Besides, the only other program I've got problems with is Nethack
: (GEM version).
: Nethack isn't intended to be run on a monochrome monitor, so maybe that's
: the problem.
: Has anyone else got a similar problem?

Yes, MultiTOS no longer works for me. I think, after reinstalling it, I
could get the desktop to run and all, but I had vague remembrances of better
features that were missing somehow - changing the system font, etc. and it
crashes way more than seems normal. How's Geneva for Falc? ;-)

>series is the most propular of their chips, but the 8051 has just as many
>ABSURD characteristics (i.e. separate code and data memory-- who though of
>that one?)

Some guys at Harvard University a long time ago thought of that one.
It's called Harvard architecture and has two advantages - Instruction and Data
fetches can occur at the same time, thus speeding up the machine, and any
program crash that occurs can only overwrite the data (normally can't write
into program memory very easily) which makes the code far more secure for
high-security projects (I would have thought that would be important in your
line of work). Most modern DSPs are Harvard architecture for the first reason.
Many safety critical machines use processors like this for the second reason,
along with a hardware watchdog that resets the processor if it is not
regularly refreshed.

When Von Neumann came along he decided program and data could be put
in the same memory, making things a little cheaper - need less memory, only
one address bus and one data bus - although a little slower.

Walter Hellman (hellman@teleport.com) wrote:
: whylesc (whylesc@btlip03.bt.co.uk) wrote:
: : I think it is true that GEM was origianlly developed for the PC. I
: : certainly have very early documentation on GEM that I still use that was
: : for the PC.

: : The interface is identical to our beloved GEM, so it is a pity it never
: : took off on the PC. Software ports would have been so easy!

: The "Computer Chronicles" show on PBS has a fascinating episode
: about Gary Kildal, the inventor of CPM, founder of DRI and inventor of
: GEM. He was apparently an academic (from Britain I think) who was way
: ahead of his time. He was doing multi-tasking DOS before anyone else was
: even talking about it.
: The show tells the actual story of what happened between DRI,
: Kildal and Bill Gates. At the time (late '70's) IBM was looking for an
: operating system for its personal computer line. DRI had GEM (or
: something that used GEM, I'm not sure) and and Gates had DOS. IBM agreed
: to sell both of them with its systems and let the market decide...or so
: Kildal thought. When the systems were made available, the DRI system
: software was priced at 5 times MS-DOS and didn't sell (of course).
: The show seemed to indicate that IBM's preference for MS-DOS came
: about because of the philosophy of Gates vs. the philosophy of Kildal.
: Gates felt the maker of the OS should be involved in the development of
: applications while Kildal felt that the OS should be put out there by its
: developer and software developers would then use it as a tool.
: Apparently Kildal felt it was wrong for the OS developer to also make
: applications. Gates got close with IBM and Kildal didn't and that was that.
: A lady involved in the business end of early development was
: interviewed and she recalled a panel discussion she, Gates and Kildal
: were at. Kildal spoke and said computers were going to be a big business
: and there would be room for more than one operating system. She recalled
: that Gates turned to her, shook his head and said there would be only one
: operating system.
: Incidentally, the story that Kildal was out flying when the
: negotiations with IBM were occurring is not true. He was there and the
: deal mentioned above was struck.
: I was very impressed by Kildal (he died recently). It seems like
: he was a good, creative person who was eaten alive by the market. The
: Atari system is really the last vestige of his GEM. It does not matter
: that the ST, etc. line uses TOS to run GEM. As others here have
: commented, the similarity to what might have been on IBM is almost
: spooky. We've still got it and virtually no one else does. Even if
: there are not many who can say it and know what they're talking about,
: "If you're listening Gary, thanks."

: Walter Hellman

Interesting. But running TOS with GEM is also a DR invention; TOS is nothing else than CP/m 68k, the CP/M version, DR developed for computer with Motoroala 68000 CPU; that was the reason Atari chose it; because there was (due to the Amiga) no time left to do an operating system of their own (thank god), they took what was already available; as I remeber, there were also other CP/m 68k workstations at the time available; I do not know, however, if GEM was ported , too (there existed CP/M 86 for Intel processors, the predecessor of DR Dos)

Atari bought a verion something like 0.9 of the GEM interface and CP/M 68k; they stripped some parts off it (namely in the VDI section what is now known as GDOS), and some features of the Desktop (other icons and the "TO OUTPUT" menu was cancelled);

GEm was a user interface that could be run and ported on several kernels;an OS/2 version was under development, a UNIX verion, too.
GEM on the PC got the constraints from Apple as of Version 2.0; from then on, they concentrated the development of GEM on the graphic routines, the VDI; long before anyone elese, they had Bezier curves and very good postcript output; GEM therfor wasn't used anymore as an operating system, but rather used as a library; development was slow, still it was as popular as Windows prior to version 3.0, as can be seen in applcations such as Ventura Publisher and GEM Artline, the former being responsible for the advances in Postscript output, the latter being resoonsible for GEM 3.11 with its true colour abilities and bezier curves;
DR made some money by distributing Artline, the direct competition to Corel draw at that time.
As Windows 3.0 apperaed, GEM lost out because it had no support for the advanced modes of the 386 CPUs, especially it couldn't make use of EMM or what is it called (that is the PC version always had the 640kB limit).

2 things are striking to me about DR:

a) Why didn't they do a version of GEM supporting extended memory?
b) Why weren't they acive at all in teh Atari market? Apllications such as Artline, Wordchart etc. could do well on the Atari; users could have profited from better GDOS and VDI development LONG before NVDI and SpeedoGDOS; they would have had Postscript output, for example; there exosted GEM 2.3 for Atari, but prts of the VDI would have beenen more than enough.

BTW, who is the small company that owns the rights to GEM now (it was mentioned that Novell sold them)?

And, before I forget, there existed even something called XGEM on the PC; that was/is a multitasking GEM (such as Magic), that runs under DRs Concurrent DOS operating system, a real time operating system that is still widely in use with process autmatisation equipment (there is even a Wordplus verion available)

Regards,

Alfred

1058. ICD Help?

Newsgroup: comp.sys.atari.st
Date: 1995-10-27 00:00:00 UTC
From: fl@pinch.io.org
Message-ID: <46qjl0$3t4@ionews.io.org>
Source record: 157107

I hope someone here can help me.

I have an ICD box for a hard disk, and I have installed a Quantum 540
meg
"Maverick" SCSI drive. The problem I am having is that my 1040 STfm
doesn't
seem to be able to recognize or even see the ICD box. When I boot with
ICD
boot in my auto folder, I get a "Cannot install hard disk handlers" message.

I am running a 1040 STfm, with 1 meg of RAM, TOS version 1.02.

I have the following pieces of ICD software:
HOST 2.08
HDUTIL 5.13
ICDBOOT 6.5.5
ICDFMT 6.2
IDCHECK 3.09
INSTALL 1.13
RATEHD 3.09

None of these work because (I guess) there is something interrupting the
recognition of my ICD box by my computer.

Any help would be greatly appreciated.

Thanks.

There once was GEM for PCs but support died several years ago.

>Just wondering, since it might be a way to give the ST a new live-
>with its GEM/TOS controlling a PC-zombie... :-)

No chance. BTW, PC GEM was quite buggy. It was no fun writing GEM
programs on a PC. Debugging was nearly impossible.

SCSI-2 introduced bus arbitration, not SCSI-3. If you need an arbitrating
driver for your SCSI drive simply depends on the drive needing the computer
to identify itself with its own SCSI ID or not. This applies to SCSI-2
drives as well as to SCSI-3.

It's no problem at all to use an SCSI-2 drive instead of an SCSI-1 drive.
But be careful choosing your new drive because of the parity and arbitration
problems with some Atari computers or drivers. There was a lot information
about this in other postings recently.

Heck, I'm not going to buy it for speed, I'm going to buy it because it's
a damn cheap mass storage. ZIP carts are down to 25,- DMs (100 megs) here.
Sure, more expensive than a hard drive, but show me a hard drive with
almost unlimited capacity.

We'll see if the JAZ drive will make SyQuest get weak in the knees.

The company who handles this is called Douglas Communications and is based in Stockport, Gtr. Manchester. I could look up their address if you cannot find it (try directory enquiries).

I think also you can get it from the ST Club who are (were?) based in Nottingham. Again I do not have the address to hand... I am sure somebody does!

>soon.

Mr. Mihocka,

- he is using one (1) copy of TOS at the same time only, for he's only
able to use one computer at the same time

- he has legally purchased TOS with his MegaSTE

Thus he is not a pirate, or gemulator runs a priated (copy from board to
RAM) TOS 2.06, too.

IMHO this article will have a bad impact on Gemulator sales. People will
think twice before they decide to buy something from a guy who calls
"piracy" what isn't considered as such by them.

He already has probs. While Janus is more expensive, it needs much less
processing power (coming with it's own 68k or 020) and IT SUPPORTS TRUE
COLOUR, while the gemulator is apparently limited to the outdated 16
colours of the original ST series.

>
>HD internal floppy??
IMHO not worth it unless you need to transfer to/from a PC. Backups
are much more viable to another HD or to a ZIP (which is on my
shopping list). Take the cost of upgrading then the price of all those
high quality floppies (about 350 floppies for 530Mb ?) and it doesn't
look so cheap anymore.

>2 more meg of RAM (so I can run GCC)??
Go for 4Mb if you multitask, not because MagiC needs it but because
you can have more concurrent applications running.

>Magic??
>Neodesk 4??
>NVDI 3.0 (for the vector fonts)
The web browser CAB will use them and you can use PC truetype fonts.

> Basically I wonder whether the HD floppy is worth the extra storage
>capacity, whether 4meg in an STE is useful. Also whether a low power
>machine such as an STE is improved at all my MagiC. Neodesk 4 is supposedly
>a lot better than v3, but does it still look nice on a medium rez monitor?

The MagiC,Ease,Kobold combo is absolutely excellent. Magic does its
upmost to run badly written software. It is possible to stop older
programs hogging all the memory so you can still multitask and it can
be told to run badly written GEM software as singletasking. I do not

like the Magic desktop at all - Ease is superb though. It knows all about Magic and will use Kobold automatically if you let it, and works with them both faultlessly. The wierd thing about Kobold is you pay all that money for it and then forget about it BUT take it away and you pine for it instantly. If you have any need to transfer lots of data about then get it (ie 8Mb from G: -> H: in 62 seconds).

I got the combo from System Solutions as its cheaper to buy the three together. I don't know if this is still the case. Btw, I don't have any connection with them!

I use a colour monitor. There's not a lot of desktop space but more can be made by dragging program names (with Ease) onto the desktop instead of the icons. Not very pretty but functional. Ease will not run in low rez but the MagiC desktop comes up instead.

The only big problem I have had concerns the Mark Willaims C command shell. I can no longer use pipes and redirection under MagiC. This is a bug in MWC though but I mention it in case it affects other older programs in this way.

They'd make money off their OS, not off your program, to be precise. And IMHO STonX should become Shareware as soon as it supports the colour depth of the emulating machines' graphics boards, for one can then run high-end Atari software (Calamus!) under X without any limitations.

Personally, I'd also like a kind of "Atari application starter" for X, so that one is able to start an Atari program as if it was an X program.

Is there an FTP site which has a complete version ready to run for a Falcon with FPU ?
From what I've seen you have to download different patch levels and compile with GCC ??? Is there a plug in and play version ready or do I have to start messing around with GCC first ?

Any help on Linux setups would be appreciated.

There is a "background" switch on the "Format" dialog. You need
something faster than an 8Mhz 68000 though because it takes just about
all that processor's time up.

It was developed by BlowUp (Munich), but the Mighty Sonic gives you a daughterboard with a 32MHz 030 and FastRAM sockets. Dunno whether the FX card does the same. Georg Acher, do you read?

BTW, H&N have announced a Multiboard for the Falcon (and they have something called "Multiboard VME, anyone have details on that one?).

>I'd be interested in what sort of performance boost you get out of the
>Mighty Sonic if you've got time for a posting and a copy of GemBench

The Mighty Sonic gives you full TT performance for FastRAM, but accesses to ST RAM (and the graphics subsystem is there) are as slow as ever. But all clean apps run in FastRAm anyway, thus they gain much speed.

1076. ST Emulation issues

Newsgroup: comp.sys.atari.st
Date: 1995-10-27 00:00:00 UTC
From: Eric Noss <enoss@planetx.bloomu.edu>
Message-ID: <Pine.SUN.3.91.951027181736.9905C-100000@planetx.bloomu.edu>
Source record: 157125

Hello,

I felt that I should bring up the discussion of ST(or 8-bit) emulation and this topic seems apportriate. I hope that this can be a vaild form for the issues of emulation, not like the Atari Pride topic which I regret to this day.

Here are the issues for discussion:

- Is it right to continue using the Atari computer on a mainstream computer? Now, mainstream computers like the Bill Gates machine do not have the interests of Atari users in mind. Rather they seek to turn them into pure PC(or Mac) users. However, the point is that there are people who have to use PC machines for work or school(special programs). But they still want to use their trusted Atari programs.

- Can you copy porgrams for the sole purpose using them on the emulating machine? There's controversy with Darek's postings as far as the use of a TOS image on STonX. But what about games, at least those that don't depend on special disk copy protection? Should you make personal copies of 8-bit cartridges on Xformer disk images? Aparently, when the patents have been made there was no need for emulation at all. Now this has all changed. Will users who transfer copies of programs to the PC stop at the hard drives or will use these oppertunity to upload them on the Internet?

- How can ST programers best use the abilities of the emulators in their applications(extra colors, higher resoultions, lots of room in memory and drive space).

- How can the emulation be improved? Processor speed is obviously faste but people complain about the sluggish "feel". Can something like NVDI improved this?

I can go on and on...these things have to be addressed because of the Atari emulation which Darek and others have helped introduced. PC and Mac emulators on the ST's don't handle games and simular programs that well so they were used for applications. If there's anything you can add about how emulation should be handed and if anyone has used an emulator feel free to tell what to expect.

There are those who feel that they rather use real Atari systems than to fake on on a PC; I respect their opinions. But for those who, for some reason or the other, use a PC and want to keep using ST programs this is an avenue to explore.

Eric Noss

: I'm not a legal expert, but I wouldn't think that running STonX with a copy
: of your own TOS is illegal. Apart from that, it is definitely not detrimental

I'm not either, but I've had to do lots of research into copyright and
trademarks lately. Yes, it is illegal. You don't own the TOS in the ROMs.
You use it under implicit licence. hat's why the copyright notices are
there.

: to Atari. This is where I totally agree with you. I do not agree, however,

No, it's very likely not detrimental to Atari. They may well think it's a
cool idea. Best advice is to ask them. If you don't ask them, you won't know
if they take exception to it.

: : What does the rest of the group think of STonX? Should we stop developing it?

: Definitely not - it's such a cool project, and I want to thank all
: contributors for the work they've done.

I think it _is_ a cool project. Find out if Atari do. By precedent under
international law, they have a case against anyone who makes an image of
their ROMs to run on any machne (even an identical Atari) other than the one
that the image was taken from. Like I said, it's probably quite beneficial
to the Atari scene, but it's best to be safe and find out what the owner of
the property thinks about it.

There is a door out of that room that goes to the rest of the dungeon. A
good trick with this type of game is to follow a wall, eventually you
will find your way through the whole dungeon using this method.

Hello,
I'm looking for a program that will allow me to play a Draogn's Lair II laserdisc interactively, with a computer-controlled LD player. Someone pointed me to this group and said that such a program existed on the Atari ST. Does anyone know where I could find it? I'd also be interested in a similar program for the Space Ace or original Dragon's Lair laserdiscs.
Please let me know if you can help. Thanks!

: Reply-to: sidcelery@cix.compulink.co.uk

: *Hi zap@eskimo.com*, on 24 Oct 95 you wrote:

: z> I was shopping for a hard drive to plug in to either my ICD host
: z> adapter
: z> or my ADAPTEC host adapter. It appears I can plug a SCSI drive right in
: z> but everything on the market is SCSI 2. My question is: Is SCSI 2
: z> compatible with SCSI 1? Can I plug a SCSI 2 drive into my host adapter
: z> card without some other modification? Do I have to get a SCSI 1
: z> mechanism? Thanks for your help.

: The basic answer is yes. My SCSI 2 Fujitsu drive has a jumper setting to
: convert it to SCSI 1 anyway, but it doesn't need to be set that way for my
: Mega STe. More of a concern is parity, but again my Fujitsu has a jumper
: setting for that too. With the ICD utilities the parity setting can be
: changed by software even if there isn't a jumper to do it.

Quantum Maverick 540s (SCSI-2) work fine too.

1087. Upgrade questions..

Newsgroup: comp.sys.atari.st
Date: 1995-10-27 00:00:00 UTC
From: jpb3@ukc.ac.uk
Message-ID: <13466@gos.ukc.ac.uk>
Source record: 157169

Recently I've been thinking about upgrading my machine somewhat, and I just thought that I might use this groups collective intellect to brainstorm what I might do to my Ste.

At the moment it is:

2mb STE with DD internal drive
DD External drive
Medium Rez colour monitor
530Meg HDD
Tos 1.62
SingleTos only
Neodesk 3
NVDI 2.5

The things I had thought about upgrading are:

HD internal floppy??
2 more meg of RAM (so I can run GCC)??
Magic??
Neodesk 4??
NVDI 3.0 (for the vector fonts)

Basically I wonder whether the HD floppy is worth the extra storage capacity, whether 4meg in an STE is useful. Also whether a low power machine such as an STE is improved at all my MagiC. Neodesk 4 is supposedly a lot better than v3, but does it still look nice on a medium rez monitor?

NVDI 3.0 with it's TrueType fonts sounds quite nice, but the only Document Processors/DTP programs I have are Timeworks 2 and Callirapher. Calligrapher will happily use NVDI for fast redraws, but of course it won't use the vector fonts at all. Whereas NVDI 2.5 Timeworks decides it doesn't like NVDI at all, and crashes.

I'd love Papyrus, but I only have a medium rez monitor, so I can't use it :(

Well, that's about all my questions I guess, I hope someone can answer some of them...

John.

: Have fun with your ftp'n!!

: -Chris Wilkinson, CACE member <chriswil@southern.co.nz>-

Yet another ripoff from my ftp list which I spent a lot of hard work
making, which Mark Smith is now handling! Irritating.

My list contains this simple sentence which most people should
understand:

>Original idea and list compilation by Hallvard Tangeraas, Oslo, Norway
>
>Now handled by Mark Stephen Smith (msh@dl.ac.uk) with permission from Hallvard
>
>This list may by all means be reproduced and distributed freely, but only
>with all data intact.

>Copyright (C) 6-July-1995

So I think it's perfectly understandable when I see my own list with
the copyright messages deleted along with everything else that I want
to have in it!

1092. Re: ZIP drives

Newsgroup: comp.sys.atari.st
Date: 1995-10-27 00:00:00 UTC
From: trek@ihgp114r.ih.att.com
Message-ID: <DH4CBw.z3@ssbunews.ih.att.com>
Source record: 157174

Well with all this talk about the zip drive and the only thing
that looks like its a problem is setting the read/write on the
whole disk, I went and got one to give it a try. (If you really
use that you could still set read/write per file - maybe a little
util to do it for the whole folder structure?)

I added it to my TT (uses ICD Pro Utils 6.5.5) by simply plugging
it in, throwing in a zip cartridge. I then ran ICDs program to
scan for the scsi id and there she was - id 5 - and it even had
zip in the table. I formatted the disk, partitioned it and started
saving files on it.

It was less hassle than the Mac or IBM folks have - they have to
load drivers etc. But maybe it was more hassle since I had to format
and partition the disk - 100M takes a while (:^)). But then I do
that frequently enough that I "know" how to do it so its no problem
either.

Speeds weren't spectacular but were better than tape. If I
remember correctly it was something like 32ms access and about
800K/sec transfer. Not a fixed hard drive but a cheap, fast
backup mechanism.

So has anyone seen if the Syquest competing drive that is
supposed to be twice as fast and is at 135M just works with ICD
software. Wayne Booth

To run Calamus, you need one or two patches (the patch prgs are available
at the German distributor, ASH, for example), depending on wether you have
a PCI Mac or not. Then Calamus just runs fine.

Yes, program that require a dongle will not run on Macs.

1097. Re: STonX and Atari ST Emulators

Newsgroup: comp.sys.atari.st
Date: 1995-10-27 00:00:00 UTC
From: sanity@mgl.ca
Message-ID: <46rh6h$i@thunder.mgl.ca>
Source record: 157179

: What does the rest of the group think of STonX? Should we stop developing it?

No way, don't stop developing it. It ran quite nice when I saw it last.
Much better than Gemulator... At least it didn't lock up at the Desk
About either like Gemulator had a habit of doing when I saw it last (ACE '95)
(that's when it was working at all)

of course when I first saw it at ACE '92 I asked Darek if it would run
bettr if it wasn't under Windows, his comment? "Why would you want to run
Windows?) Enough said I think.

And at least other users here aren't from the same city as him like I am.

Even though the Umich mirror at src.doc.ic.ac.uk hasn't been updated
properly for ages, the original site at atari.archive.umich.edu is still
being updated, although I didn't see anything there that isn't at HENSA
or some other well known site.

I found this letter about the Zip drive:

>> It's an SCSI device. SCSI devices understand SCSI commands,
>> specifically, the ZIP drive behaves like a SyQuest. The only thing one
>> can not do yet with an Atari is setting and removing the write
>> protection of a media.
>
> I'm still looking for information how to do this. Unfortunately nobody
> seems to know.

Someone knows for sure!
HiSoft have written routines for the Zip, that allows software eject, write protect and password if I've understood correctly. These routines aren't sold seperately, but are delivered together with the Zip's that come from HiSoft.

Best regards,

Claes

Yep, plenty of both of them around here, all the store have them.
One thing, the SCSI EZ is priced at $259.95, $60 higher then the ZIP.
Seen an add for the Iomega JAZ drive. $599.99. This can use
540Meg or 1Gig Cartridges, $74.99 and $134.99 respectivily. Claims
5.53MB transfer rate, 12 MSec average seek and 17.5MSec average access
time.

I'd like some feedback on this. I've seen a Mac LC running at 16MHz with a 68020 play apple quicktime movies very well! Certainly quicker than my TT. I even use a very fast graphics card. Since I can play lexicor film files at 640*480, 16 cols and 60 fps, I'd expect a 160*120 avi file to run at least 15 fps!

Ahh, but GEMView does work - I used GEMView for this exact purpose a year
ago.. All you have to do is set the Colors option in presets (I think)
to 240 colors (to preserve the first 16 colors) and set it going.

If you need ALLa 256 colors, ImageCopy will do it.. You need to set the
color mapping to match colors, and you MAY need to set the pallet to
'Screen', I dont remember if I had to do that or not. I used ImageCopy
to make even some 16 color pictures with the default pallet.. worked -
although quite a bit ugly. :)

I came across this a few days ago (IIRC it's some sort of AES ?replacement? for MiNT). Unfortunately it was source only, and needed gcc to compile, which I was having trouble setting up at the time, so I didn't keep it.

Having finally sussed gcc out, I thought I'd have a look, but I can't recall where I found it.

I know it's only a couple of clicks from the "Other Atari stuff of interest" web page at Hensa, but I've been running around in circles all day trying to find it (I really ought to be doing some work, but some of the links have been pretty slow, so I've managed somehow). I'm fairly sure that the site was in Sweden somewhere. Not surprisingly, Archie couldn't help.

Anybody got any ideas?

Be seeing you...

1113. Re: GEM for PC's?

Newsgroup: comp.sys.atari.st
Date: 1995-10-27 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DH4qF9.CGB@freenet.carleton.ca>
Source record: 157195

There has been a lot of discussion concerning GEM for the PC lately
on USENET. I use the product and think it is great. I couple
of things that make it better than Windows, X-tree or DOS shell
for many users are as follows:

1) GEM for PCs works on any PC from a humble xt to a pentium.

2) this very easy to use GUI (familiar to any Atari user) only takes
up about 300K of disk space.

3) GEM for PCs can make many limited resource machines useable by people
with no computer background. For example, my father in law didn't touch
an XT we gave him (for father's day) until I put GEM on it. Now these two
old timers get along famously.

4) any DOS program that can run from a DOS prompt will run under GEM
for the PC. This is the case because memory intensive applications can
be configured to "take full memory". When this is done gem unloads itself
seemlessly from memory and gives all RAM to the application, then reloads
itself when the application ends. This is just plain different from DOS
Shell, Windows, etc. which hog precious conventional memory.

5) GEM can be completely loaded into high memory on 386 machines (or above)
running DOS 5 or above.

6) GEM for PCs can not only run all DOS programs (native) but also runs
dozens of GEM for PC applications which don't run under DOS. These applications
take advantage of many special GEM features (including common fonting systems
desk accessories, etc. Again as familar to any Atari user.

GEM for PCs doesn't run ST applications on your DOS box (and however many times
I say that, someone will still manage to miss the point. it also isn't
emulating anything. It is just giving a DOS based machine a much nicer user
interface (but that is a lot to offer).

I like version 1.2 the best because if is a direct equivalent to the ST
desktop. However version 3 (which doesn't have the trashcan and movable
scaleable windows of version 1.x is also a great product and presents the user
with a higher resolution desktop (640X480X16 versus 640X320X2). This differencedoesn't
effect the resolution of DOS appliactions launched from the GEM
des
desktop but may effect the resolution of GEM applications.

I will welcome any questions people may have.

Regards,

Keith M.

cb092@freenet.carleton.ca

p.s. I don't think there was a version 4 for PCs. 3.0 was released at the end of 1989. Also Apple's suit against DRI was probably intended as a warning shot across microsofts bow

Source record: 157196

Since this "conversation is not over yet, I'd like to add "my
three cents to it"

As a former Pc user I found the system to be very difficult to
handle; I wonder if people that buys pc's *** REALLY*** thinks these are
cheap. I had tons of problem making the system run; probably hundreds or
thousands of Hours of my time; now let see: if I only charge $ 5.00 per
hour: Does it make pc's cheap machines? Besides all the frustration and
the poor personality and practicity involved in the software...
Now, 1995, we find pc's waking up with an operative system made
up of STOLEN IDEAS from other platforms; Where in the world do you find a
machine whose best triumph is to become today -sort of- multitasking?. Now
pc users smile, the same as their "leader-software-maker". They have
forget that ethic applies to all human creations and should be granted
respect.
As time goes by, someone has to pay for the computer evolution -all
of us- and it would be better to support the best platforms around,
otherwise we are not going to the future, just updating from the past.

I am glad someone asked that question. I have installed a SyQuest EZ 135 on my TT030 with ICD Pro Utilities 6.5.5 as a SCSI device. The SyQuest I bought was a SCSI 2 for the Mac but the cartidges format fine (note I formatted it as FAT not SCSI). The data transfer rate 1550 K/s, access seek 21ms. The drive has a manual cartidge release and the ICD software gives you a media change sense alert in the upper right hand corner of the screen that doesn't crash your system.

>> Is there a Jpeg viewer for the STe?
PH>
PH> Several, the best is probably Speed Of Light V3.8. (aka SOL). This
PH> displays in 256 colours.

SOL won't show 256 colors on an STE. It shows a maximum of 32 colors (flipping two 16-color images), though it practice it doesn't even show that many, because many of the colors will be duplicated.

Intellect? Who, me?

1) Since the STe is alleged to be easy to add RAM to, that is where I would start. If there is a computer junk yard near you, you can probably find chips there that will work. Even if all you do with the extra RAM is use a meg or so for a RAM disk, the difference will be quite functional and noticeable.

2) Many users have spoken well of Magic. It is high on my list of "to buy". Supposedly it gives a speed increase of about 20%, while throwing in the multitasking at the same time.

3) I have not tried Papyrus, but if it is half as good as it is supposed to be, it would be a good choice. Find an SM147 (I hear they are scarce in uk), and you'll love it. I even loved my SM124, but a bigger screen would be even better. I used a "two-headed beast" for a little while, after I got a mono monitor, but noticed that I was using the color less and less.

4) HD floppy is very low on my list. If I were going to be swapping a lot of big files with pc users, it might move up on the list a little, but even then it is an expensive upgrade, considering the functionality. Might be cheaper to find a floptical, and certainly will be more cutting edge to get one of the new Syquests.

Just my 02 cents worth.

Atari Boise Users Group have several 1040STf's for sale.
Unfortunately, they don't meet your "nice but not necessary"
specifications. 1 Meg, TOS 1.02, no sockets for cpu or memory. The
one we are currently using as the club's computer is stable as a
rock. The others have been simply checked out, but we can grab one,
get one of the club members to use it for a while, and he can attest
that it is stable (if it is!). We are currently asking $90, you pay
shipping. We are asking $40 for one with a bad power supply, if you
feel up to fixing or replacing the power supply (we have lots of
them with bad ps's - work fine with a good power supply plugged in).
If you are in the US Northwest, this might be a good deal for you -
otherwise, the shipping is probably too much.

: up Geneva cuz it is MUCH faster as a MultiTos kernal. I will send
: a list of bugs I've found so far - Gribnif has produced real quality stuff
: and Geneva/Neo are great but still need some work esp. with Mint.

I think that Geneva is generally very good. Somehow I tend to find myself using it instead of TOS 4 or MultiTOS... This newest version looks very good, and appears to be quite reliable, too.

As a hint for Gribnif, though: besides the bug-fixes and improvements people here and in MausNet have asked for, I'd like to see a much improved file selector - and a chance to use things like Freedom...

Also, NeoDesk 4 could be improved by letting people use the same keyboard shortcuts for changing directory windows' contents as are used in TOS 2..5 (Control-driveletter). With that, I think I'd change NewDesk to NeoDesk =)!

Well, since you asked nicely I will explain.

First of all, there are rules on the internet. Posting private email
to a public newsgroup is generally considered to be bad manners, but
since you've already shown a complete lack of morals or scruples, I can
understand it coming from you.

Regarding the blitter bug fix. At the time, it was before you had
released STonX and before I knew that you intended to distribute the
product the way you did. In exchange for the information you gave me
about blitters, I sent you some tips on ways you can speed up your
emulator. I've been writing emulators for close to 10 years and I know
what I'm doing, so you can choose to use the tips or ignore them.
Whatever.

Now, the meat of the question. How are you a pirate. Well, if you read
the licensing agreements on software, you will see that you are
permitted to make backup copies of the software. However, you are
licensed to use ONE copy of the software on ONE computer. You are not
licensed to make backup copies to give to your buddies, nor are you
licensed to use the backups on multiple computers. Whether software on
disk or software in ROMs (such as TOS), the one copy one computer rule
applies.

Now, if to use STonX you ripped the TOS 2.06 ROMs out of your Mega STE,
and then used something like an EPROM burner to dump the ROMs to a file,
then yes, you are technically within the law. However, this is not how
the STonX documentation tells you to do things. Instead, it tells you to
use a utility that YOU provide to run on a functioning Atari computer to

dump the ROMs to disk. Once you take that disk to your Unix box and run it, you now have two copies of the same software running on two machines. Thus your own documentation requires users to violate the one copy one machine rule.

This is no different than if you and your buddy go to a computer store, buy one piece of software, make a copy, and then each go home with one copy of the software. We all agree that is piracy. Yet we conventiently ignore that in the case of STonX. Two people two machine, or one person two machines, same thing, because chances are the Mega STE that was used to dump the ROMs is being used by some other person.

Why does Gemulator not violate the rule when we both know it copies the TOS ROMs from the card to the PC's memory for speed reasons? Because Gemulator a) runs the same copy of TOS on the same machine the ROMs are plugged into, thus doing the same thing that many popular "TOS patch" programs do on real Atari computers, and b) any attempt to remove the ROMs while Gemulator is running will result in a machine hang. Thus you don't violate any licenses. In fact, Atari U.S. gave their full blessing to this scheme over 3 years ago when I was first designing the Gemulator.

What you don't have is any authorization from Atari to allow users to run multiple instances of their ROMs, and by today's definitions of what is piracy and what isn't, to require people to dump ROMs from an operating Atari computer is considered piracy.

It's a further black eye to the Atari community that many of the users in this newsgroup are blatantly discussing how they pirated their TOS ROMs. This is not something that looks good for the Atari community, will not attract new developers or keep existing developers around much longer, and it certainly doesn't help the few remaining Atari dealers around to stay in business when an amoral developer such as yourself chooses to do what you are doing.

Since you chose not to discuss this with me in private email as we were, I am explaining my position in public. The fact that many of the users of this newsgrooup don't agree with what I'm saying doesn't surprise me since my straight-to-the-point attitude doesn't go over as well as the sugar coated messages other developers post, but it doesn't make your product any more legal.

The reason Gemulator requires a hardware card, the reason Magic Sac required a cartridge, the reason Spectre required a cartridge , the reason Janus requires a card, and the reason other emulators require hardware of some sorts is specifically to stay legal.
As I asked you several months ago, what alternate method, legal method, do you have to allow your users to use your product. Your answer so far seems to be "none". You have no legal standing to distribute your product.

Are you using the ICD LINK adapter? It won't work with the default Quantum maverick, on the other hand if you are using Link II or ADscsi from ICD you should be able to get it working.

The maverick, I think, (I ordered one, couldn't get it to work, didn't want to pay extra cash for shipping to a dealer, etc) need software to disable the parity on it... no jumpers y'see. :P

If you know someone who could change the parity in Firmware for ya, it should work though.

As far as I can tell, there is NOTHING wrong with this method IF you dump your old machine/ROMs. The other alternative is if you use one computer or the other.

In those cases, you're not breaking the one computer/one use law. The trouble is that there is a *situation* where the law could be broken but if the user is conciencious, then they can avoid breaking the law.

A copy program is not illegal. A program that uses copies of ROMs are not illegal. It's the user's procedures ALONE in this case that can be considered illegal.

For instance:
I copy the roms to disk for StonX. - 1 copy of ROM running
I shut off my ST. - 0 copies of ROM running.
I boot my UNIX box and run StonX with the disk image. - 1 copy of ROM running.

Sure, we all know that 90% of the users will most likely have both machines running but without the police standing behind them, there's nothing that can be done. You also can't call the program illegal just because it can potentially set up an illegal situation. That would be like banning spoons because some drug users use them and that having them would be potentially setting up an illegal situation.

So at best, owning/developing this program is a question of ethics at best and a question of being legal at worst.

> This is not something that looks good for the Atari community,
> will not attract new developers or keep existing developers around much
> longer, and it certainly doesn't help the few remaining Atari dealers
> around to stay in business when an amoral developer such as yourself

The only developer it seems to annoy is ST emulator developers for UNIX.
If your a developer, it doesn't matter what machine your program runs on.
If you can sell it, you can sell it. If developers cared about the amount
of piracy in a particular market, there wouldn't be ANY PC software.

Every time an emu program is made that keeps the effective market for
ATARI software from shrinking. Rather than just moving to a PC, a UNIX
box or a Mac, ST users can still use and buy ST software because emulators
exist for those platforms. This is better than the old days when there was
just one less ATARI user. All the developer sees is that people are still
buying his software.

> The reason Gemulator requires a hardware card, the reason Magic Sac
> required a cartridge, the reason Spectre required a cartridge , the
> reason Janus requires a card, and the reason other emulators require
> hardware of some sorts is specifically to stay legal.

True, but what about the Macintosh based ST emulator (whose name escapes
me at the moment)? That is pure software.

The trick there is that the programmers made a clone OS from scratch.

> As I asked you several months ago, what alternate method, legal method,

If the developers really wanted to make it so that there was no *possible*
illegal situation and they want to keep the product solely software based,
they should get together in gnu-like glory and make a clone rom from
scratch using clean-room techniques.

However, now, there is nothing truly illegal about their product.

Darek, I don't believe your posts are "sour-grapes" but on the off chance
that they are, you have nothing to worry about. Your products are aimed
at totally different markets. Yours is aimed at DOS/Win users and theirs
is aimed at UNIX users. While many DOS people do use the Linux flavor of
UNIX, they certainly would need BOTH products if they spend any signifigant
time in both environments.

Anyway, that's my $0.02

Spectre GCR was perfectly legal as far as I remember and that required Mac
ROMS which the user had to procure him/herself. As far as software licences
go I thought is was legal to install software on two of your own computers
is the software is not to be used on both simultaneously. STonX could
cetrainly fall into this category.

Futhermore, with the support Atari have given to computers in the past few
years (ie ZERO support) its up to the users to keep their platforms useful.
I would have trouble using anything less that a TT now so StonX is possibly
a great way for people with St's and Ste's to move up without have to buy
a TT (which are pretty scarce these days).

If Atari complains about this kind of work then they are alienating the
people who have done their advertising for them for years. They wouldn't
even still be around if it weren't for the existing user base so it would
not be in their interest to pull any kind of legal thing - how much money
can they possibly make off TOS? How much can they make when dedicated
Atari users buy Jags or introduce their friends to Jags? Nuff said.

>programs I tried to get to work..didnt..
>
I also patched up to Geneva 004 and it is very disappointing when running
over Mint - LOTS of crashes and complete hangs - TOSWIN doesn't work
(although I'm trying to fix that). Neodesk does not work as an AV server
with anything I've tried (Everest,Duftp,Gemview,etc.) I am curious
as to which programs it DOES work with.

I still find AES 4.0 far more stable with Mint - I hope Dan will fix it
up Geneva cuz it is MUCH faster as a MultiTos kernal. I will send
him a list of bugs I've found so far - Gribnif has produced real quality stuff
and Geneva/Neo are great but still need some work esp. with Mint.

1138. STFM system for sale

Newsgroup: comp.sys.atari.st
Date: 1995-10-28 00:00:00 UTC
From: bjcorr@delphi.com
Message-ID: <9510280245591.DLITE.bjcorr@delphi.com>
Source record: 157138

Alas, time and space have forced me to part with my STFM. Here is what I have;
STFM, TOS v.1.0 w/Zram board, filled to 2.5meg, can go to 4 meg, internal 360k drive, original mouse.

720k Golden Image External Drive

3 monitors (color & BW Goldstar, color JVC)

Tweety board
Small assortment of games (F-19, Police quest, etc...) and some PD stuff

Magic Sac cart w/roms NO software

Specter cart NO roms or GCI w/software

All works, although mouse acts a bit flakey. $200 + shipping or BO.

I have played DM2 on a PC and it is pretty much the same - it is really disappointing IMHO - really short compared to DM (which was the reason I bought an Atari over an Amiga, also the case looked better!). It has a few new spells, most noticably you can create small helpers which can move independantly of your party, and it has an inbuilt map, although it only displays about 6x6 squares.

Those mummies really scared the s**t out of me when they suprised me

> What does the rest of the group think of STonX? Should we stop developing it?

No way - it's a great idea - running an ST on a *stable* platform and OS.

Darek must agree that it is a great idea - I am curious as to what
solution he would propose. You cannot walk up to the SysAdmin of your
company/university and ask him to plug some EEPROMs in! Having TOS as an
image file seems to be the best answer.

I personally think that Atari have it coming to them - they havn't really
supported the platform for years and it is going to die out unless it is
improved upon. Atari's best (and most popular choice) would be to let
people use TOS and anyhting they have got, which will otherwise just
going to waste - e.g. TOS 4.92 which is supposed to be much better than
the version that people currently have.

The problem with this (apart from the fact that Atari won't do it) is
that it would be unfair on the dealers which have it already stocked.

Where does your friend live? There is bound to be a BBS in his area.
If it is London there are at least 3 good boards specializing in
Atari.

Let me know and I will send you some local to him. Suggest that he
gets another Comms programme when he gets through though.

A good board in London that I point from is:
The Tavern BBS 300-32600 MNP5 V42Bis 44-(0)181-445-6514 24 Hours |

Paul would like a contribution of a pound a year. (or more if poss).
Everything else is free although I think there is a small charge for
accessing Internet newsgroups through him. He has access to Email
through Internet. Is that all correct Paul?

I all actually Atari is no longer producing computers; however, they have licensed TOS to 3rd party developers. Thus TOS has not been abandoned. A great deal of Atari's technology is still under legal action, ie. the Sega and Atari suite was settled out of court. Sega gained additional licenses to Atari's technology and Sega is buying 4.7 million shares of Atari stock over a set period of time.

Enough said.

I have a similar inquiry regarding IBM 3270 emulation. Does anybody know of a terminal program which offers this? It's one of those terminal types that send the entire screen at a time (as opposed to line by line) and also sends coordinates of data entry fields. You then enter and edit the data without any real time communication involved, and then the field contents are sent back. There is a program called SimPC for MS-DOS which has this emulation, and currently I use it with a Vortex AT-Once 386 emulator, but there are a lot of data transmission errors at high speed.

If anybody knows of such a program written for the ST, please let me know. Thanks in advance.

I'm also running a Quantum Maverick 540 with my STe and an ICD The Link2 adaptor with no problems :-)

I'm a bit confused by you saying you have an ICD box for a hard disk. Do you mean an ICD adaptor in a case? If so, what adaptor? Adscsi, adscsi+ ?

Try running ICDBOOT.PRG in an auto folder on a floppy and then format it with ICDFMT.PRG and make it autoboot with HDUTIL.PRG.

Good luck.

: a single copy of an operating system they abandoned years ago!

I don't agree with the original statement that using a TOS image for
STonX is illegal (frankly, its a foolish statement), but this above
statement needs some reflection. A copyright lawyer can give you more
details, but from what I understand, even tho a company has abandonded a
system, they still retain the rights to that system. Just because Atari no
longer supports TOS does not automatically void that copyright.

Sure. That's trivial. Assuming that you have an IP network going, that
is (via SLIP, PPP, PLIP or whatever). All you need is xhost on the
Atari X, and do an xhost + (or xhost address where address is the IP address
of the PC). I've run Netscape for SunOS on this machine, with the display
on my Falcon. Show as shit over a 14.4k line, but it can be done.

So here's the million dollar question. Buy or sell Atari? Who thinks Jaguar will succeed this Christmas? Who thinks will lay an egg? At 2-1/8, Atari could be a bargain. What are the predictions of where the stock will be on Dec. 31, 1995? Higher? Or lower? Lest we forget, in 1993, Atari went from fifty cents a share (!!) to $12.50 in less than six months, following the original announcement of the Jaguar. That was 2,400% profit. At it's current price of 2-1/8, a 30 percent profit could be realized by year's end, if it indeed creeps back up to 3+. What say ye, experts?

>
>They'd make money off their OS, not off your program, to be precise.

True, but they wouldn't be able to sell it independently. So altogether,
they'd be making money off STonX. And I wouldn't like the idea of people
paying for STonX, while they have a perfectly legal copy of TOS at home in
their ST.

>And
>IMHO STonX should become Shareware as soon as it supports the colour depth
>of the emulating machines' graphics boards, for one can then run high-end
>Atari software (Calamus!) under X without any limitations.

I don't think I'll do that (make STonX shareware). It's not that I dislike
the idea of Shareware, but since I cannot guarantee that I'll have a specific
amount of time to work on it in the future, it would be wrong to ask people
to pay & hope I'll improve it later. Besides, I just like the idea of free
software too much. :-) Also, the main problem with 8-bit colour depth or more
is that I don't have sufficient documentation about how VDI should be extended
to use it. Higher resolutions will be implemented soon, though.

>Personally, I'd also like a kind of "Atari application starter" for X, so
>that one is able to start an Atari program as if it was an X program.

That's a bit of a "next generation" project. If I had the time to write a
TOS-compatible OS, implemented in C and based on native Unix system calls,
this should be fairly easy... It would only work for very "clean" programs
though.

There is one called Howfast2 (it's German by the way). It works by drawing a graph of how fast your hard-disk is at copying blocks of various sizes. You have to set several parameters - IIRC how many times to copy each block, the maximum block size to copy and how many intermediate block sizes to try.

] Try ftp.uni-kl.de instead.
] I must say though that I am very disappointed with the 'MiNT-compatible
] of GEneva - if the demo is anything to go by. It crashes every 5 minute
] requiring a complete re-boot. It wont run Thing without MiNT.

The full version seems to be very crashable. Although, MiNT crashes an awful lot on my machine anyway (fine using Minix or something, but didn't seem to like Neodesk 4 much).

I got the patches from either atari.archive.umich.edu, ftp.cnam.fr or ftp.uni-kl.de AMong those three, I've found the patches for Geneva, Neodesk and STalker to upgrade to the latest versions. Not the patch for STeno however.

Geneva seems to be marginally better, still no quick-find function for the Task manager program-settings list though, which makes wading through long lists a bit of a nuisance. Seems to be a bit quicker though.

Neodesk 4 mainly is just a _lot_ of bug fixes (the list is huge!). It's now a lot more stable, and more friendly with non-"standard" resolutions. The new feature of telling Neodesk, rather than Geneva to single-task a program, requires creating a program-info' file for that program, rather than just as an Installed App'. This is also a nuisance. Takes up more disk-space, and is a hassle to keep track of. At least it does work however :)

As always, (usually), the latest version is the best to have. I'd forget about trying to run Geneva with MiNT though, it doesn't work too great. Running normal Geneva is a lot quicker.

>Search etc.

Forms are on their way, and doing pretty well.

>2)How long before CAB handles other HTML stuff like mail and FTP (possibly
>chaining to a seperate program).

Mail I don't know. Supposedly DuFTP is being ported to work with STiK, once
that's done it should be trivial for Alex to build in the option for an
external FTP program in Cab.

>3)Who is ressponsible for the above development ? Alexander Klaus, Tim Newsome
>or Steve Adams ????

Alex: Cab, the browser
Tim: CAB.OVL, does the HTTP protocol on top of the SLIP.
Steve: STiK, does the SLIP protocol.
Unfortunately Steve is rather busy at the moment, because I'm starting to
think that the crashing problems are in his code... :-(

>4)I use a MegaSTE with CAB, is there a way I can listen to sound in HTML
>documents ??? I see that CAB supports external programs, is ther one that
>supports playing sound (from CAB) on and STE ???

There must be somewhere...

>5)Similary for JPEG pics ??? (nb. CAB crashed the other day when getting a jpeg,
>I presume the cause may be the lack of an external program.

Gemview, Speed of Light.

>6)What is the cause of the instability in CAB (the fact it can crash every now
>and again), is this down to CAB, the overlay or STiK - Nb. I'm not refering to a
>fault with my provider or dial scripts.

I'm afraid it's STiK, and that might be a long while to be fixed, as Steve
is busy atm. I do have the source, but finding a bug in 230K of source you
haven't written is not easy.

>I hope this doesn't sound too picky or anything. I don't use netscape or any

>Misinformation, misinformation... I have two ZIP drives working happily on my
>Falc and on my ST. The ZIP drive can simply be treated as a removable harddrive.
>No problem whatsoever.

Ok, a little question for you about how to connect a zip drive to an
ST. From what I remember reading in the STF review, there was a
little problem with power and termination lines. Has this been fixed
or do you still need an existing SCSI device connected ?

Next part of this question relates to my own computer. I have a Mega
STE (TOS 2.05 - old ?). It has an internal harddrive, 48megs, fitted
when the computer was made. Does the presence of this drive mean I
have a SCSI host adaptor inside the computer ?? how can I check ???
can I use this to connect a ZIP drive ???

Ta for any suggestions

1169. Laser Printer Smearing

Newsgroup: comp.sys.atari.st
Date: 1995-10-29 00:00:00 UTC
From: fox@vulcan
Message-ID: <470672$pol@filet.nrlssc.navy.mil>
Source record: 157074

Calling all SLM users... I recently changed the toner
in my 804 (the first time I've ever had to do it in about
8 years of use, so obviously this is not a heavily used
printer!). Almost immediately, it started having problems
printing. When I print a multi-page document (or request
multiple copies of a short document), the first page or
two come out fine, but each subsequent page gets progressively
worse. More and more of the page comes out black, with
the a smeary appearance. If I let the printer sit for a
minute or so and print, the first page comes out fine again
but later pages come out blacker and blacker - repeating
the process again.

Any ideas?

I bought this toner about a year ago and it's been sitting
on my shelf sealed in it's original box. Since the toner
in the printer has been working fine for 8 years, I can't
believe it would go bad sitting on the shelf...

Something very basic going wrong here! HOST should recognise the ICD host adapter at least and IDCHECK ought to pick up the SCSI
device.

Has the ICD host adapter worked before for you? With a different SCSI device perhaps? Concentrate on this. Is the host adapter getting power? It needs 5v only. Is the DMA cable faulty? Try to get a meter to check cable continuity. Any chance of checking the h/a with another ST? Could be that the ST DMA port is
bust.

What is the adapter in the ICD box? An AdSCSI+, I hope. Forget the HDD for the mo. - just get the h/a
recognised.

Any answers are likely to be subjective. So much depends on what you use the machine for.

j> The things I had thought about upgrading are:
j>

j> HD internal floppy??

But why? With all that hard disk capacity you probably only use the floppy for porting stuff in and out.

j> 2 more meg of RAM (so I can run GCC)??

Yes. See also next para.

j>
Magic??

Yes. v2.? was a real revelation to me on an ancient STM. This is multi-tasking the easy way. I can't say that I use true multi-tasking but it is very convenient to have a number of applications open and ready to run. Also the speed improvement is very impressive especially if MagiC is complemented by NVDI. If you are going to use it even just as a task switcher it's a good idea to get your full complement of RAM.

j> Neodesk 4??

Hmm..don't know this very well. If the MagiC desktop doesn't suit you I have heard positive comments on how nice Thing is with MagiC.

j> NVDI 3.0 (for the vector
fonts)

Yes, the vector fonts is the only benefit over 2.5. Depends how much you
will use vector fonts, I suppose
:)

As well as all this why not think
about...

A mono-monitor. Sooooo... much nicer if you are using "serious"
applications involving a lot of text. You can pick up a decent second-hand
SM124 for £40-£50 and a monitor switch box for £5-£10. If you are really
flush with cash you could sell your med. res. monitor and get an
appropriate
multi-sync.

A tape-streamer to insure all the data you have on the hard disc. A second
hand 150Mb unit will be about £80-£100 and you ought to be able to chain it
onto the SCSI-out of your hard disc
host-adapter.

Tderrick (tderrick@acpu.com) wrote:
: thietavu@news.abo.fi (Tommi Hietavuo TKKK) spake thusly:
:
: Tommi, I have enjoyed your posts in the past, and respect your
: thoughts, mostly. But I have to take issue with you on this point.
:
: I believe in honesty wholeheartedly. Your "what are people to do"
: attitude is wrong, IMHO. If you can't find the software you need and
: want, learn to write it, damn it. If it is a game, too bad. Nobody,
: nobody, nobody _needs_ a game!

I respect your view, too. These are very difficult questions, and it's
awfully easy to misunderstand people's opinions. This question of
honesty touches our deepest attitudes. Some people would literally die
before breaking the laws. Not many, but some... And some would break
any laws, no matter how sensible or crazy those were. Most of us, I guess
, try to be honest - but at the same time listen to our heart and brain.
And because of that, sometimes one disagrees with some laws. Should
people have obeyed, e.g. Nazi-German laws? I guess, not. Not always,
at least. Not, if one is human. But yes, if one is 100% lawful =-(...

I myself can't accept the idea of being honest just for honesty's sake.
It has to mean something to someone. Words are only words. In this case
of TOS/STonX I just can't see the loser - either economically, or in any
other way. I only see winners: people who might have to change their
computer platform (expensive, and often unpleasant..) have a chance to
use their familiar Atari software on a UNIX computer. Atari wouldn't
benefit much, I think, if those people couldn't find the legal TOS
-versions anywhere, and decided that "Well, too much trouble - I'll
buy a Mac, or a PC..".

: : There is no excuse for piracy.

You may be right, but world is complex. Sometimes something that looks
black appears to be white in the end - and vice versa.. But it's good
to talk and share different opinions.

You can try the PD 1st Word to RTF converter to create an intermediate
format which MacWord should read, or you can load up another
word processor called (I think) Marcel's which can
read Forst Word and export text in several ways. It's a great
program.

Both of these are available from Umich/Wuarchive via ftp.

All IMHO. ARC is history. There is no reason to use it anymore. ARJ
is lame. ZOO is good for compatability with VMS systems. That leaves
ZIP and LZH.

Supposedly LZH has the best compression ratio, but it's not as wide-spread
ZIP is.

1180. STuff for Sale

Newsgroup: comp.sys.atari.st
Date: 1995-10-29 00:00:00 UTC
From: Terry.May@rebel.genesplicer.org
Message-ID: <728_9510300316@genesplicer.org>
Source record: 157085

I have the following hardware for sale:

Atari 520ST with 2.5 megs of RAM, TOS 1.2 and SF314 floppy ... $125 obo
U.S. Robotics 14.4k HST Dual Standard modem ..... 75 obo
Atari mouse (brand new) 20
Atari Mouse (slightly used) 15
Practical Solutions Monitor Master 15
Practical Solutions Mouse Master 15
StarFighter joysticks (2 each) 10

And the following software (all include original disks and manuals):

CodeHead Utilities .....$ 10
Degas Elite 10
DeskJet Utilities Pak 10
GFA Basic 3.5E 25
G+Plus GDOS replacement 10
MultiTOS 25
Pac-Mania 10
STipple Image File Viewer 10
STyle Image Manipulator 10
Tempus II text editor 15
Ultimate Virus Killer 10

Prices do not include shipping. Prepaid or COD only.

Package deals available upon request.

* LED v1.31 * AtariNet - Coming soon to a BBS near you!

Competition from a freeware author? Wow, that's a new one. I always
fantised about writing a better DOS compatible OS for the PC and giving
it out as shareware just to tick Gates off :)

I was also wondering if I can run my games under Gemulator 4. Darek told
me that only copy protected games won't work b/c of the different timing
of the PC drives, the BIOS, and such.

>

I think it's only ok to copy a commerical program if it's to run on an emulated system. You don't need to do this on a native Atari and to pass around copies to other people is pirating which is just plain wrong. I did say in one of my postings this is one of the issues we have to face in Atari emulation. So far, I have a theory that using Grape Stomp and Divert to B: may solve but it's such a long shot. Maybe ST game programers should make it easy to install on the HD. At least use the floppy as a key disk if you want to mantain copy protection(these guys have to eat and provide for families so I don't blame them).

If you are going to crack games to put them on the hard drive, at least use the ones you already bought and keep them to yourselves.

Nick, I'm trying to type up a ST FAQ for new people. I got the idea
because I kept typing the same thing to other people who ask. I have
some school work to do today but I get one knocked up and posted.

Any questions you like to see answered in it? :)

I will have to agree, Atari has even gone after big companies like Sega
for using techiniques for games on the 2600. Again, when is something
piracy(when you copy and give something to other people), and when do you
need to use a certain program on an emulated system? BTW, I disagree
with pirating programs for profit or to give to others for nothing. So
what do we call running TOS 2.06 on Linux and 8-bit cartridges on
Xformer?

> memory.

Not does Windoze 3.1 take up all the needed resources, you still have to get at the special PC hardware. DOS will let you do this as programmers only use it just for the disk functions, but you have to go through Windows for the graphics and it makes game developing under Windoze just unacceptible. Win95 is suppose to provide gaming drivers to correct this mistake, hopefully we won't have to be burden with the 640K ceiling anymore(if programs are willing to actually make 32-bit programs).

> Tru enough if you buy Win 95 and a 16 Meg PC then things run
> ok, but why do you need 16 meg to run doom, when on a
> 4meg machine it runs fine in DOS ????

Ever noticed ever since Windows 3 came out, people had to upgrade to higher CPU's, more memory, and bigger HD's every six months instead of every two years? And now 8 Meg is not enough??? Does Microsoft think every PC user is a well to do business executive with a gold card and money to blow? At least you can get Ram doublers that can compress the memory space for Windoze. And if that DOS program needs all 8 meg, it will go into a special protected mode and shrink itself to a smaller size and let you run games as if it was DOS(it's a variation of DOS 7 actually). However, I only seen this on the Final Beta so I don't know if the actual product won't choke on this. But I did run a demo of FX Fighter on a store PC running Win95 and it worked out ok.

> My solution - microsoft should start again with windows. I saw some rather
> slanderous materail once, aobut win 95 and how many parts are from win 3.11.
> I ain't gonna quote it here 'case I haven't got enough money to get sued.

It's no secret that Win95 uses 16-bit code from the old Windoze and even Ye Ol' DOS, but it's for backward compatiblity. So no it's not a true 32-bit OS like Linux. They just don't want Win95 to look like smokestack

technology compared to OS/2(which also depends on bits of DOS and Windows 3.1). Besides, I think Microsux is busy enough with "being" sued by the goverment, which uses PC's in their offices BTW.

Anybody any idea how I can convert .MED (OctaMED ??? amiga) music modules to .MOD (protracker 4/8 channel). I can use a PC or ST, an suggestions as to software.

I've already tried Octalyser V0.96 but my version crashes when I select the OctaMed option, rather than 4Chan Protracker.

And if there isn't one out there - does anyone fancy writing one ??? Just look at the number of picture convertors out there, and how many mod convertors ??? from what I can tell, zilch.

Thanks !!!

Hi Harry,

MIDI Spy is probably the best tool for the job, from System Solutions in
London. It converts between MIDO 0,1 and 2 formats but costs 69ukp.

The other product is MIDI hacker from Profile entertainment for around a
tenner which also does the job admirably.

Email Andy.Curtis@dial.pipex.com for further info.

Cheers,
Andy.

The Branch Always Software web site has just been considerably updated.
I've added new pictures of the Gemulator and PC Xformer programs and
their related hardware, more detailed descriptions of the products,
updated the dealer list, and added new sections.

If you are looking for information about Atari 8-bit emulators for MS-DOS and
GEM, or for the Atari ST/STE Emulator for Windows 95, please visit the web site
for Branch Always Software Online at:

http://www.halcyon.com/brasoft/

If you have visited the site prior to October 30th, force your browser
to reload the pages to make sure you grab the updated information.

>in the computer.

It depends on how close to the transmitter (field strength) you are.
That short length of co-ax from the computer to the telly will act as an
aerial and will cause interference.

Personlly this Channel 5 should not be allowed to broadcast at all.
The UHF band was not designed for it, anybody who thinks it's just a
case of re-tuning their video's etc is in for BIG surprise come switch on
there will be no where to tune your video to in some areas, Channel 5 is
going to use all but one of the vacant channels around channel 39..
The vacant channel is already used by Heathrow Airport Radar.

Hi, on the news a couple of days ago there was an announcement that someone had won the bid to broadcast the 5th terestial TV station. In the bit on the news, the mentioned that all videos will need re-tuning so that they dont interfere with the broadcast. As the ST/Falcon/any console uses the same frequency (?) as video's (ie they are tuned into the same thing) does this mean that they are also going to be retuned??

I don't think you can get many good games (except Doom) or WYSIWYG
word-processors, spreadsheets etc. for Unix. I agree that it is a great OS,
but it is an absolute bitch to set up. I'm saving up for a nice fast PC to run
Linux though.

Dungeon Master 2 is a much-enhanced new game. Chaos Strikes back was pretty much the same thing with different monsters, maps and equipment.

The original was Dungeon Master. Then, Chaos Strikes Back, and recently, Dungeon Master 2 - which is only for the "current" machines (PC's etc.)

: anyones insights on a good virus killer. the few that I've run across
: seem to only support floppy drives but not HD's. I'm more concerned about
: my HD at this point. Any suggestions?

There are two kinds of virus, bootsector and link virus. You can't get a bootsector virus from the internet (except perhaps with a MSA archive, as these store the bootsector?) So, if you'r not getting MSA files, the only thing you need to be careful of are the link viruses. On the Atari, tehre are very few link viruses, so it's probablyu not much of a concern. The best virus killer is UVK, this will recognise about 10 different link viruses, and can kill them.

A link virus attaches itself to an application. You cannot get any kind of virus from a text file for example. And even so, the virus can only take effect when you run the programme. Just having the programme with the virus on your HDD is not going to hurt anything. For this reason, you do not need to download to floppy disc, this would be a waste of time as it makes no difference to the likelihood of catching a virus. To check for a virus, you would need to de-archive the archive, then load UVK and get it to check any executable (i.e. programme) files. The virus cannot take effect simply because you de-archive it, you need to run the programme that it is attached to for the virus to load.

So, as long as you check all executables before running them, you cannot get a link virus.

If you use MSA files, there is a chance of getting a bootsector virus (I think MSA stores the bootsector, if it doesn't then you can't get a bootsector virus this way.) Since MSA only de-archives to a floppy disc, you can just de-archive it and run the virus checker on your floppy disc. The only time this might be ineffective is if there is a special bootsector stored in the MSA that is _meant_ to be there, like an auto-loading game. In this case, the virus killer might prevent the programme from working ,and you would have to de-archive it again. If this is the case, you cannot have a virus, as the bootsector (where the virus resides) is filled with the code to load the game/programme.

If you miss a bootsector virus, and it gets into your system, it is unlikely that it will get onto your hard drive. Only a few viruses are capable of copying them selves to a HDD. If you are unlucky and get one that does, the only current way of getting rid of it is to back up your HDD and reformat it, AFAIK.

Remember, however, that a nasty virus could still damage your HDD, even if the virus came from a floppy disc. And if it loaded from the hard

disc, it could still affect a floppy disc. I think that there are very few viruses which will damage files on your hard disc, however, so this is not too much of a concern, probably.

The most likely way you might get a bootsector virus, is by using a disc that came from somebody who had the virus. The virus loads when you boot off the disc. If you get a disc containing a bootsector virus, the virus will not load unless you boot off the disc.

So, unless you use MSA or similar archive, you can't get a bootsector virus from the Internet, or a BBS.
I believe UVK can be obtained from System Solutions in the UK, contact them on ssolutions@cix.compulink.co.uk. I'm sure Toad in the USA would have it also, info@toad.net is their current address.

: Don't you mean HELP ME ???

: Anyway here goes:

: First of get yourself a comms program that will record while online
: (even vanterm does this), a buffer.

: Now turn the buffer record on, and log on, typing in your usual
: password, usernames et al. Then when you get gibberish, log off (hang
: up) and save the buffer.

: Next step is to look at what the computer sent you, and yuor response.

: these things need to be set up in the dial.scr file as the FIND - RESP
: parts.

: check that the items come in the right order, that its looking fro the
: right thing. Its no good the server sending username: and stick
: looking for login:

: also remember you can abbreviate eg. username: to ame: qand password
: to word:

: check also that you have upper and lower case letters in the right
: places.

: make sure that STIK knows what you recieved and typed to get logged on, up to the
: point where the gibberish kicked in.

: Once this is done, then all should work perfectly.

: If you still have problems, then send me your dial.scr file (blank out
: the password with *****s), and also the saved buffer file that you
: recorded, and I'll see if I can find the problem. (Nb. please archive
: both, and don't send me ALL the gibberish in the buffer, just upto
: where it starts, hopefully the full file won't be more that 10K).

: Hope this helps.

[pedant mode on]
AT = 286
[pedant mode off]

> Why ? A 286 is very slow.
Agreed.

I can recall that Amstrad produced the PC1512 and PC1640 IBM PC-XT clones
(wow! an 8086 CPU! with 512 or 640k of RAM! super-WOW!)

From what I can recall, they didn't carry GEM on the AT models they
produced (at least not those that were on sale here in NZ around 1987-ish)

There is a Swedish program that's extremely fast on the Falcon (but there is also an ST version of it) that handles samples, can find loop points and much more - it's called ZeroX. I believe there is also a program from Steinberg, called Avalon, that is a good sample editing program too.

> It would also be nice if there was some sound-generating

I don't remember the features in Avalon, but maybe - if you're lucky...

What you think is not necessarily correct. (Happily.)

WYSIWYG word processors is currently an area of weakness. A release
of WordPerfect 6 is, however imminent, which will go a long way towards
combatting that.

There are at least *three* commercial spreadsheet packages including
Wingz (of Mac fame).

Games-wise, things are *somewhat* limited. This area is coming, though.

Setup is also coming along. Various vendors and users are coming up
with improved and easier installation schemes.

You can even run your Atari software, at the risk of raising the
hackles of certain other producers of emulation systems. :-)

You call that priacy ??? I really think not, they are his TOS ROMS, in
his computer, and he isn't using the copy and the original at the
same time, so he isn't pirating them. If he started to modify the
copy, or sold/distributed it THEN it would be piracy.

>
>Unfortunately the makers of legitimate Atari ST emulators (Gemulator,

The people who wrote STonX didn't actually pirate any ROMs did they
??? Or are you accusing them of piracy also ???

>
>I've said it before, and I'll say it again, Atari users are all a bunch
>of damn pirates.
>
>- Darek

So what you are actually doing is coming onto an Atari usenet group
and accusing every single atari own er reading it of piracy ??? are
you stupid or something. Sounds to me like you are bitter about
something ??

If we are having a legal argument over pircay of ROMS, does anyone know how us atari users stand on being able to sue for the above statement ???

If you think atari users pirate software, you really aught to see some PC users at work, from what I've seen, there are a hell of a lot of PC users who pirate software also.

I hope you aren't going to try and sell anything to atari users in the future !!! can you really imagine an (ex?)atari owner buying gemulator from someone that calls him/her a pirate ??? Dream on !!!

Seems to me that if you EVER write anyhthing even ST related then you are going to lose a lot of sales to atari owners, especially as many of my non-interneting friends will recieve a warning about your soft/hardware, and how you have great respect for your potential customers, NOT !!!

If you are pissed off about how you can;t sell stuff then just shut up and go crawl into a hole, theres no point blaming the makers of STonX just 'cause they are honest enough to make their stuff freeware.

Its people making statements like this that REALLY piss me off, if you don't like Atari users then just piss off and find someone else to buy your stuff. And just home they don't pirate it !!!

I wouldn't know about a Call For Votes, but I reckon it'd be a
resonable idea to create a seperate group. As for traffic, take a
look at the physics.accelerators newsgroup, you're lucky if you get
posts/week, and about half are spams !!!

Personally I'm not dead against adds in this news group, but I'd
prefer not to have to download and sort extra messages (I use a demon
account which automatically grabs the whole lot), especially when I
don't want to buy or sell anyhting.

Extra stuff that could go to this newsgroup are those asking where
certain software can be bought, where dealerships are, and people
asking for recommendations on what HDD, ST etc. to buy.

If this were done then it would probably reduce the mail here buy
about 50%, and leave the stuff that really should come here, eg. flame
wars, how do I get this program to work queries etc. etc. etc.

Thats my bit said.

1213. Death Of the ATARI ST

Newsgroup: comp.sys.atari.st
Date: 1995-10-30 00:00:00 UTC
From: dda@dcs.ed.ac.uk
Message-ID: <DH9LID.34x.0.staffin.dcs.ed.ac.uk@dcs.ed.ac.uk>
Source record: 156980

As much as I love the old Atari ST - I hate to break the news to you guys - it is dead! My computing days started on a 16K Spectrum, moving onto an ST in 1986. Right up until last year I spent a long time mucking about on the old workhorse. I then came to realise that the old beast has finally come to the end of her life. Just like the spectrum and those before her - she had her life, a very advance computer for her time - truly a machine whuch brought affordable 16bit computing to the masses for a good price. But that is where she should be left - in the past. In a day where computing power is unbelievably fast - faster than it need be some argue - the old girl just doesnt cut the grade. I was a staunch defender of Atari - but I came to realise that we just have to move on...

The way forward is with UNIX workstations - none of your PC or Mac shite. For real power, good fast programs and the potetial for fucking great games - the Unix workstations are the way forward. Do not let UNIX scare you - in this day and age there are so many shells for UNIX that it need not be the scary monster that it was ten years ago - it offers an excellent environoment to work under.

Please take my advice, sell your ATARIs while you still may make some money - I mean you only have to look at the price they are going for and even the size of ST Format - all fucking 2 pages (exaggeration)..

May she rest in Peace.....the ST is dead....

1214. FX and CAB-STIK-CAB.OVL don't work together !

High all !

Look there is a way this don't work ! ;-)

If i start a nacked falcon with STIK.ACC and NVDI, CAB and CAB.OVL works fine,
but with FXDRIVE in AUTO-Folder (without the CPX which turns the FX-Speed on)
CAB breaks down and send a message like:

RUNTIME error 163 in ADRESS FFF.... (diffrent)

(same with the CPX in 36/36 and 40/40 mode)
I try it with the flags to run/use in TT or ST RAM any possibility, no effect.

Does CAB don't like a litle more mem or maybe not the speed ?
Please help !

> ^^^^^^^^^^^^^
>That's simply what *every* SCSI drive does. If it doesn't work there are

No, not every SCSI drive knows about bus arbitration. Bus arbitration was defined in the SCSI-2 specification and all SCSI-2 drives know about it. This doesn't mean all SCSI-2 drives need drivers that support bus arbitration. Most SCSI-2 drives can do without it but recently there were more and more drives, especially new Quantum series, that require the bus initiator (i. e. the Atari) to identify itself with its own SCSI ID. As arbitrating drivers give TT and Falcon their own ID such drivers are the only ones to work with these kind of drives.

>other reasons. I know of bugs in some older drives (e.g. LPS 170) having
>formware bugs concerning the synchronous negotiation mode. When the

With the Atari synchroneous operations is not possible so any bugs concerning the mode won't affect Atari machines, I guess.

>driver asks the drive for synchronous transfers the drive's firmware
>simply crashes. I don't know if this is fixed now.

No driver for the Atari will as a drive for this kind of transfer because it is not supported by the Atari SCSI/DMA hardware.

>Another point is disconnection/reconnection. Some drives try to
>disconnect even at normal R/W operations which is nonsense for harddrives
>(it slows down my drive from 1.2MEG/s to 650KB/s!).

Which drive do you use?

>I recommend to simply try different drivers if you can get hold of but I
>think even the original driver should work.

Not with drives like the Quantum Fireball series. These drives require the Atari to have its own SCSI ID and this is not supported by AHDI or other drivers that don't support bus arbitration.

I'm looking for any Atari users in the western North Carolina area in the United States. I'm been out of the Atari scene for quite some time and am looking for someone local to help me out. Thanks.

Does anyone know of any FTP or WWW sites for demos such as ones from The
Lost Boys or The Carebears? I'd like to see if there are any new ones.
Thanks.

I haven't been in the Atari scene in a while, so please forgive me. What
is Gemulator 4.0 like? Last I heard of Gemulator it was version 2.0.
Please EMail me about it.
Thanks.

>I had (perhaps somewhat smugly) always maintained that my TT was better in all
>respects (except possibly in the abundance and quality of software) from the
>crummy DX2/66 I use at work. I have to say however that the combination of PC

That DX2/66 is probably something like 5 (five!) or so times faster than
your TT. What makes the PC look slow is mostly the OS and applications.
Even my PowerMac at work is slower for some things than my Falcon and
that PPC machine is easily more than 10 times faster in raw processor terms.

>I suspect the data throughput might be the cause but I assumed (again somewhat
>smugly) that the TT bus running at what I thought was the system clock speed of
>32mhz was far superior to the PC bus (16 bit? 16mhz?).

IIRC the 32 bit TT bus runs at 16MHz since the machine was originally
designed for a 16MHz '030. The memory bus in a DX2/66 runs at 33MHz and is
32 bit wide. On top of that the 486 has 4kbyte (or is it 8?) internal
cache memory versus the TT's 2*256byte and the PC is very likely to have at
least 128kbyte external level 2 cache, which will help memory performance
immensely.

>I am not a techie, so can someone explain why I grow old and grey waiting for
>movie files to play?

Finally, those files probably assume a 'chunky' graphics mode, while the
TT modes are all 'planar'. Without going into details, that means that
the TT would have to do some time consuming operations to get anything
to the display (unless you're running a graphics card).

ProTracker is shareware. The copy on umich is the unregistered version
with some features disabled (and a few bugs?). The latest and fully
registered version is now being handled exclusively by Merlin PD. It
comes with replay sources in assembler, standard ProTracker ST sample
disk with 102 sounds, and an extra Merlin sample disk. Not to mention
the *complete* printed user manual, which is about 130kb long! Price
is 15UKP.

If you need proper notation instead of the standard tracker hexadecimal affair
then this is better, otherwise it's a bit slow on a standard (or even MegaSTe,
mine struggled to replay at 25kHz while in the editor...) and not nearly as
powerful as ProTracker.

1228. Monitor PTC1426 is dark...

Newsgroup: comp.sys.atari.st
Date: 1995-10-30 00:00:00 UTC
From: gartmann@immunbio.mpg.de
Message-ID: <472mi9$bpk@n.ruf.uni-freiburg.de>
Source record: 157091
Cross-posted to: comp.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

we have a colour monitor PTC1426 connected to an Atari TT. Now this monitor is out of order - it remains just dark, although the little green LED is on and you can see the tube for the screen gloom. We brought it to a dealer but this one asked for at least US$ 350 to repair it. So we went to the next dealer and this one told us he will do it for US$ 150. But after two weeks he told us he couldn't do it because he couldn't get the necessary parts, the manufacturer would no longer be in business...

Perhaps I should add that we have never been quite happy with this monitor: From time to time he showed a very greenish picture, sometimes for one minute, sometimes for ten minutes. And then the green flair just disappeared. And this happened not very often and of course never at the dealer. In addition it produced sometimes a very high tone (not very loud). This phenomenon didn't seem to be correlated with the green problem, but who knows.

Thus, if anybody has an idea what to do, let me know.

Regards,
Christoph Gartmann

> J > do you really think there is enough traffic here to warrant a
> J > separate For Sale/Wanted newsgroup?

I was the one who originated the idea of a buy/sell group back at the beginning of August.

Due to the declining health of my aging mother, for whom I've been looking after, I had not put as much effort into doing the background research, setting up a RFD, and so forth as required when creating the group.

I guess i should have posted a short "postponement" message here, rather than just leaving things hang in mid-air. Sorry.

At present, the number of buy/sell posts are somewhat lower than when I originated the discussion three months ago. If you base your decision purely on sale/wanted posts right now, I guess that most of you would vote "no".

But, in the sake of true democracy, would anyone out there like me to restart the newsgroup creation process?

If enough of you feel it is worthwhile, I'll start the process rolling again.

Dumb question first! Have you tried to to format the drive? It may not be booting because the drive is already formatted. If not, I wonder if the interface board doesn't accept a partiy-enabled drive and this one has it enabled. If I remember correctly, some Quantums have parity set in software and there was a patch program from ICD which turned it off - but you needed an interface which accepted parity on in the first place.

:-)
On a normal ST MGIF is not much good for a quick view in colour, but if you let it reduce the number of colours to 16, you'll get a pretty nice display. It'll take a while, though.
On an 8 bit graphics card or on a Falcon or TT, MGIF produces very good results IMO.

JPEG loading in greyscales is rather quick with MGIF, but colour is slow. The GIF loader is the fastest I've seen, but I've heard it said lately that there are new versions of the APEX viewers, which may be faster on a Falcon.

>All the programs are shareware and can be downloaded from most good Atari
>boards.

Actually, MGIF is FreeWare. Also, the latest version of MGIF can not be downloaded from anywhere but the WWW/ftp site in my .signature.
A new version will be uploaded later today.

MGIF v5.00 is still considered a beta version, but it has been working very nicely for a _long_ time. I just never seem to get around to actually releasing it.
I'll post a final request for comments RSN(TM), but don't wait for that if you have anything to say.

> limit).

I don't know of any basis for this comment. I have used all three major releases of GEM (1.x, 2.x and 3.x). In all cases GEM doesn't perform any memory management tasks. It leaves these to your underlying DOS.

GEM can address as much memory as you have on your system to exactly the same degree as it can be used by any application run from the DOS prompt. Further as I have noted previously GEM can be configured to unload itself from memory (to run memory intensive applications) then seamlessly (and quickly) reload itself when the app is closed. Windoze and DOS shell can't do th and this is why not all DOS applications can be run in Windoze, etc. Finally GEM can be entirely loaded into high memory (on machines with a 386 or better and DOS 5 or better).

I short GEM for PCs has no memory management shortcomings. On the contrary.

My college still has the version of GEM for PC. The sofware was a GEM
GUI interface thingy to use instead of DOS or Windows, it was VERY
inferior to the ST GEM, especially in the desktop department, and even
more naff compared to TOS 2.0x upwards. They use it here for running
older versions of Timeowrks on PC. Please note that it wasn't an
emultor, it just ran PC software on a PC, using a different interface
to DOS. Support I din't know about, I just used it a couple of times.

>Just wondering, since it might be a way to give the ST a new live-
>with its GEM/TOS controlling a PC-zombie... :-)

I really don't think it was up to that, it was just like a windows
type thingy, giving you a GUI when running progs etc.

If you want to access you PCs, Harddisk/CDROM etc. then you could try
Ghost Link, although its still in Beta Version (PD) and I think its
probably been ditched (any ideas anyone) it still works fine for me.

Sounds like a flow control problem.

>
>I used Fpatch1, 2, hsmod and friends, and still the same problem.
>btw. it is connected to a Falcon. It is not the serial port, for I used to have
>a 2400 connected to it, without problems.

One of these should have worked. I use SerialFix. This has CPX
modules which makes EVERY rpgrma use RTS/CTS flow control and so fixes
the problem. To get say FPATCH 1/2 to work you need to find out what
flow control they use, and then set your modem to use that also.

The problem is not with the port, but is with TOS, I'm not sure
if Atari corrected the probelm on Falcons ???

If the buffer overflow occurs when uploading data then this is
probably the problem, otherwise send the modem back !!!

Good luck

scruggs@cis.ohio-state.edu (kevin eugene scruggs) said:-

What does the rest of the group think of STonX? Should we stop developing it?
What intrigues me is that no-one ever just re-wrote TOS to get
around that problem. It's relatively small and one might actually
be able to improve upon it as well...

No don't stop with STonX. It'll prove very useful when I go to uni.
As far as I know using an image of ROM you own isn't piracy, as long
as you don't use the image and original at the same time.

Re-Writing TOS would be an interesting idea, but surely it would make
software incompatible, to fix this bits of original TOS would be
needed, and that would be illegal.

Hope you continue development,

Phil H

>Does anyone know of any FTP or WWW sites for demos such as ones from The
>Lost Boys or The Carebears? I'd like to see if there are any new ones.
>Thanks.

As far as I know the best place in the Uk, is SRC.DOC.IC.AC.UK in the
pub/packages/atari/umich/Demos folder, here there are quite a few of
the best. most are Magic Shadow Archived, so you'll need to get a
copy of that to use them. Get the index for a complete list of all
the demos.

As this is a umich archive in the US you could try:

mirror.archive.umich.edu, or umich itself (although this is usually
VERY busy).

Most really recent demos are for Falcon now, but there are some
goodens out there (grotesque, Hifi Dreams) but don't hope for anything
too modern (theose examples are about '92/'93).

hope this helps

>
True, but unless you are very close indeed to a major transmitter, I doubt it will be a problem. The coax lead is screened to avoid pickup of external signals, so the computer's signal should dominate.

The real problem is going to come with video recorders. Even now, I can't find a channel to tune my VCR to that elimiates cross-channel interference. O.K., so I am using a cheap Amstrad portable, which doesn't have very good selectivity, but I reckon I am going to present a serious challenge to the person doing the retuning.

>Distributor pricing.

Fair enough, Joel. But what, in your mind, distinguishes a DEALER
from a DISTRIBUTOR if not _volume_? I'm not privy to the exact
deals that Toad was able to wrangle out of Atari on hardware but
I would imagine that every dealer had the same opportunity, IF
they could come up with the necessary funds for a bulk purchase.
It's the same situation as discount store chains... they can sell
for less because they purchase in quantity deals. Atari, as ever,
was only interested in the short-term bucks, not the long-term
effects of such dealer/distributor policies.

As an Atari software developer for several years, I can only point
to Atari HQ for the current state of the market today and, conversely,
to Toad and other hangers-on for allowing what market we have to
continue as long as it has.

For a "dead" computer, there's a lot of life out there. :)

>intelligence. Please...

I don't think you owe anyone an apology, Eric. Your comments (at least the ones I've read) were logical and framed as personal opinion. Certainly not flame bait, IMHO. There are those that treat computer brand loyalty like a religion and stoop to a posture far more demeaning to themselves than their intended target. That's too bad, but hey, it happens. We're human.

Each to their own is a fine attitude to take. I appreciate the Atari mostly for it's ease of use, but I can also recognize the utility and worthiness of the Mac, and yes, the PC, too. Let's face it, in the long run, the computer wars will only serve to benefit we, the users, with faster and easier-to-use systems. Without competition, everyone would be staring at a C:/ prompt today. :)

>Roger
>rcain@nest.demon.co.uk

Slightly off the thread this but:

I have so far found one program that will change between mono and colour, and back again without reset. The program is a chip music demo, by big alec. If eun from a mono desktop (it is a small 50K program file, not a protected disk), and the colour monitor is switched on (both are plugged into a monitor switchbox, what the chap wants to get) then the demo runs, switches to the colour monitor, does its stuff fine and then when you quit (press space) it just flicks back to the mono monitor, no resets, no huge delays like you get when you change low to med res. Any ideas ???

BTW: I bought my monitor switch things from First Computers, I don't know if they still do them, in fact I don't know if they even sell ST stuff anymore, you could give them a try though

>Is there any way of forcing posting whilst on-line?

Whilst online type smtp kick (or sm k) to send mail and nntp kick (n k) to send
and collect news...

mail is queued before being sent.... make sure all items in the queue are sent
before exiting... sounds like you aren't waiting for all items to go...

When posting news you'll see the message 501 Newsgroup for each article posted..
this should happen before you see the new headers arrive.

You can include the kicks in startup.nos so you don't have to type them every
time , just add the lines....

smtp kick
pop kick (if you have a POP mailbox and the newer NOS.TTP)
nntp kick

Cheers,
Smn..

Hi,

I recently read something about memory fragmentation, and that any application can only use the memory in the largest free block.

Is this true ?

If so, does that mean that because my memory is usually split into 6 blocks (I have 4Mb), that although my ST says it has, say 2.7Mb free, that in reality I only have a much smaller amount that is actually of any use ?

Can I 'fix' this problem ?

Cheers,

Kevan.

Message-ID: <9511010400092127 5@acpu.com>
Source record: 157012

WD> From: W.de.Jong@telecom.ptt.nl (Wiebe de Jong) Subject: Comm.
WD> between ST and PortFolio Help!!! Can someone tell me what
WD> program to use (and where to find) on my ST to establish a
WD> proper connection between my ST and a PortFolio (for up- and
WD> downloading files in both directions). I've already made the
WD> physical connection using some piece of serial interface
WD> hardware and a 0-modem cable, but none of the communication
WD> programs I have will do the job.

It has been my (small) experience that this newsgroup tends to
ignore the more obscure questions. Sorry for mentioning it, guys. So
I am going to try to help this person, even though I don't know the
answer that will help him most.
I am looking at an article from Atari Interface Magazine July 1992
Vol 4 (now defunct). Bill Rayl, the author, tells of several ways to
start the ball rolling for ST to Portfolio transfers. He lists these
options:
1) Borrow somebody's IBM and use it to transfer a telecomms package
to your Portfolio.
2) Buy the DOS Utilities Card from Atari dealer; it has XTERM on it.
3) Find another Portfolio user who already has a terminal package on
it, copy the card.
4) Purchase TransporT, use it to transfer terminal package to
Portfolio.
5) The rest of the article is about how the author did a transfer
without any of the above, and without spending money. I am not going
to type the whole thing in; it is way too extensive.
Hope this helps.

dda@dcs.ed.ac.uk (David Ashcroft) spake thusly:

DA> sell your ATARIs while you still may make some money -

ROTFL!

David, have you looked at what people are getting for their old
ST's? My advice is for people to keep them; there is no money there
- at least not enough to help with a Pentium or PowerMac purchase.
If you hang onto your old ST, buy a TT or Falcon or (saints preserve
us) a pc-zombie or PowerMac, you can still use that software that
you have grown to love that won't run on your new hotrod.
Nobody who lives in anything bigger than a broom closet should sell
a computer that he likes. The depreciation curve of any given
computer resembles the glide path of a set of car keys.

TH> thietavu@news.abo.fi (Tommi Hietavuo TKKK)

TH> Should people have obeyed, e.g. Nazi-German laws?

It depends, as so many things do, on whether your government is legitimate or not. Mine (USA) seems to be pretty borderline.

My grandfather had a reputation for 1: bitching about silly laws and 2: Obeying them. But there is big difference between silly laws and catastrophic laws.

I consider the laws that have grown up around the computer to be pretty legitimate - and I wish that we had had them in place years ago, back when certain parties were dealing fast and loose with the intent of copyright laws.

This example of the horror that was Nazi Germany is over-used, Tommi. (And my apologies to our German friends in csas.) Their laws allowed or required atrocities. Our current copyright laws do neither, IMHO.

I reiterate that it is this attitude, that of "I bought this computer, now I deserve software, no matter what I have to do to get it" coupled with "I don't have the money, so somebody ought to give it to me", that rankles me. And it is this attitude which drives the free-lance socialists on all computer platforms to steal the products of another man's time, brains, and sweat.

That certain people "pirate" their bought and paid for TOS Roms for their own private use in something like STonX, I consider trivial. Probably Atari Corp does, too. The legal questions spawned here may keep the courts busy, and lawyers buying summer homes, for quite a while. Since, as others have pointed out, the question is in our "fair use" and "product liability" laws, don't look for a resolution any time soon.

I don't think it is very hard to comply with the law for the "STonX Newbie" - one computer, one user is hard _not_ to comply with (unless he starts giving away or selling the TOS disk images). I think you and I would both agree that _that_ would be both a legal violation and morally wrong.

ARCShell by Charles Johnson makes lzh and arc bearable. But I second
the above sentiments: STZip is king! All hail Vincent Pomey!

Well, I guess that depends. I use my ST for music composition and it is really great! Now, I can get software that I couldn't afford before (because the platform is considered dead). So, go ahead and get onto another platform (and sell your software and hardware off at a steep discount:-).

>The way forward is with UNIX workstations - none of your PC or Mac shite. For real

>
>May she rest in Peace.....the ST is dead....

You won't get s**t for the ST today. Perhaps $200 for a 1040 ST upgraded to 4Mb.

As for platforms, I have a computer at home that my office got me. A Pentium 100MHz system with lots of memory. I must say, Windows 95 is very, very nice on a fast, big system. And, I get to boot Solaris for x86 also. But, I use the Solaris partition for software development and the Windows partition for everything else. Why? Volume, Volume, Volume! PCs own the desktop today. UNIX workstations are great for niche tasks, but for general purpose computing you will find a dearth of software (and it isn't any cheaper than PC software).

Have fun! - Bob

ZIP is standard for the PC world, SIT and CPT for the Macintosh world,
ARC, LZH, ZIP for the Atari world. I find most of my Atari files are LZH,
followed by ARC and ZIP.
It would depend on what sort of BBS you are conecting to. I connect mostly to
Atari BBS's, but even those PC BBS's I connect to, while having most of their
PC files in ZIP mode, still have most of their Atari files in LZH or ARC, as
well as ZIP.

~^

Sell my ST? Not a chance. 90% of my computer needs are Sequencing and patch editing and storage and editing samples from my midi sampler. My ST accomplishes all this inexpensively and efficiently.

Plus what would I get for my ST? Here in the part of Canada I live in you routinely see Monochrome 1040STs selling for $75 and colour for $100. I couldn't even buy a decent midi interface for another platform for what I'd get for my ST.

Plus, look at the size of the ST. Sometimes I play at clubs and need to use sequenced tracks in my live performance. My ST makes a perfect sequence file player. There are midi file "jukebox" programmes for it that will let me select songs from a playlist using the function keys so I don't even need to bring a monitor or a mouse.

What is the other 10% of my computer needs? Telecommunications, which FLASH v1.6 more than suffices. After that the remaining 2% is games. There are plenty of great games for the ST, but should I want more I've also got a PC for that (and to take care of what telecommunication tasks I can't adiquately handle on the ST which are very few).

I'm a musician first and foremost and the ST is the MOST efficient and economical system for my needs.

They can have my ST when they pry it from my cold dead fingers.

When all I had was an ST, I found that Paula asked just a leetle too much of the cpu. After I got this TT, I tried Paula again and fell in love. But I suspect you need some serious horsepower to make Paula as happy on the ST as her namesake is on the Amiga with no(?) help from the cpu.

BTW, how does one create a MOD on the ST/TT? All I've ever done is collect them.

PD> Anyone have recommendations
PD> for a nice text-file scanner-prg, either a useful replacement
PD> for the desktop Show Text (with scrollbar or ability to scroll
PD> in both dirs at least) or just a nice standalone program like
PD> the Multitos "Viewer.app"...anyone? anywhere? thanx

I am crazy about SuperView. It can be slightly flakey at times, but it replaces the ShowPrintCancel, loads files smokin' fast, scrolls both ways, searches, prints, hexdumps files, keeps several files in memory at once, displays Protext and WordWriter files readably, and about anything else one could want. Plays samples and shows Degas pix, too. It won't clip to the clipboard, at least in the version I have. The Protext display is the biggie, btw. All us Protext users should have SuperView, imho.
I was using SuperView on my ST, and moved it over to the TT when I got it. STFormat (Frank Charlton) didn't like it for Newdesk. In fact I like it better in Newdesk than in the ST. SuperView replaces the ShowPrintCancel nonsense in TOS 1, but must be used as a desktop app in Newdesk. So in Newdesk I have the choice of whether to use it or not. Double clicking gives me ShowPrintCancel, or I can drag the file over to Superview if I need its features. This either/or can be nice, especially if you want to do printing from PageStream disk files or the like. I got SuperView from an STInformer disk of the month about a year ago. I think the author is Norwegian.

DC Shower (that's Show-er, not a wet vertical bath) will hook into Universal Item Selector, IIRC. Might be a nice feature.

STInformer and others have spoken well of MasterBrowse, which I bought some time back; I don't like it as well as SuperView. But it will clip to the clipboard, which would be nice sometimes. Author is Michel Forget; look for MBB_49, I think.

Hi there !

I was wondering what programs there are for MIDI-connected Atari STs.
Could u PLEASE help me !
Of course I know MIDIMaze (2 and beta-version of 3), but there must be more
than that ! or not ?
BTW, I'm about to write a few programs that make use of the MIDI-net myself
!
(right after my exams now ...)

* Are there still people, who write MIDI-net-games, or at least WANT some
new ones ?

* What the hell is available anyway ???
(I would like to make a list of all "Midi-net-workable" stuff ...)

* And is there still somebody wroking on MIDIMaze 3 or was that project
given up ?

! please folks ! I need some answers !
(best per EMail -> <NIP73@rz.Uni-Kiel.d400.de>
... I'll send a follow-up myself if it's worth it ;)

I just bought Dungeon Master 2, and I'm looking for a list of spells from the first game. I can remember some of the essentials, like healing, fireballs, and dispell, but I haven't played it for a few years and need a refresher. :) If someone could post the spell list or e-mail it to me, I'd be eternally grateful... Thanks!!

Date: 28 OCT 1995 03:33:25 GMT
From: Darek Mihocka <brasoft@coho.halcyon.com>
Newsgroups: comp.sys.atari.st
Subject: STonX and Atari ST Emulators (long)

I have read Darek's posting with explain his views, but as I read it
questions keep popping out.

>First of all, there are rules on the internet. Posting private email
>to a public newsgroup is generally considered to be bad manners, but
>since you've already shown a complete lack of morals or scruples, I can
>understand it coming from you.

It's true, bad things happen when you do this. But keep that in mind
when I mention the contradiction of statements.

>Now, the meat of the question. How are you a pirate. Well, if you read
>the licensing agreements on software, you will see that you are
>permitted to make backup copies of the software. However, you are
>licensed to use the backups on multiple computers. Whether software on
>disk or software in ROMs (such as TOS), the one copy one computer rule
>applies.
>
>Now, if to use STonX you ripped the TOS 2.06 ROMs out of your Mega STE,
>and then used something like an EPROM burner to dump the ROMs to a file,
>then yes, you are technically within the law. However, this is not how
>the STonX documentation tells you to do things. Instead, it tells you to
>use a utility that YOU provide to run on a functioning Atari computer to
>dump the ROMs to disk. Once you take that disk to your Unix box and run
>it, you now have two copies of the same software running on two
>machines. Thus your own documentation requires users to violate the one
>copy one machine rule.

Now, when I read the copyright licensing on a couple books that
included program disk(one of which is Microsoft), they said that you
may use the software on a single machine connected to a single
terminal. This may be either the ST or the single Unix workstation.
You are prohibited from using copyright software on the network. Nor
are you allowed to modify the software. You are also not allowed to
use it one more than one machine at the same time. So you better not
even use a null-modem connection to transfer the TOS image

>This is no different than if you and your buddy go to a computer store,
>buy one piece of software, make a copy, and then each go home with one
>copy of the software. We all agree that is piracy. Yet we conventiently
>ignore that in the case of STonX. Two people two machine, or one person

>two machines, same thing, because chances are the Mega STE that was used
>to dump the ROMs is being used by some other person.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Chances are that one may actually buy the TOS ROMs and install it on one's own ST. Again, buying your own software and making a backup to use on another machine is legal as long as it's not modified, networked, or even someone else's copy.

>Why does Gemulator not violate the rule when we both know it copies the
>TOS ROMs from the card to the PC's memory for speed reasons? Because
>Gemulator a) runs the same copy of TOS on the same machine the ROMs are
>plugged into, thus doing the same thing that many popular "TOS patch"
>programs do on real Atari computers, and b) any attempt to remove the
>ROMs while Gemulator is running will result in a machine hang. Thus you
>don't violate any licenses. In fact, Atari U.S. gave their full blessing
>to this scheme over 3 years ago when I was first designing the
>Gemulator.
>
>What you don't have is any authorization from Atari to allow users to
>run multiple instances of their ROMs, and by today's definitions of what
>is piracy and what isn't, to require people to dump ROMs from an
>operating Atari computer is considered piracy.
>This is no different than if you and your buddy go to a computer store,
>buy one piece of software, make a copy, and then each go home with one
>copy of the software. We all agree that is piracy. Yet we conventiently
>ignore that in the case of STonX. Two people two machine, or one person
>two machines, same thing, because chances are the Mega STE that was used
>to dump the ROMs is being used by some other person.

Now, someone told me through e-mail that I should be able get copys of 8-bit cartridges to run on Xformer. The person even mentioned cracked files that I can download. But if I were to run say Donkey Kong on a 486, then I would copy the cartridge the I had bought already and somehow get it on the virtual disk file. And if I don't have the cart I want to copy, then I better buy the actual cart not the cracked file on the disk. And nobody else is ever going to get the game that's on the PC hard drive. Now, is this any different than using my own TOS from my own computer on Linux and not giving it to anyone else. Can this be a contradiction? Somebody had better come up with answers if we are going to use emulation on computers.

>The reason Gemulator requires a hardware card, the reason Magic Sac
>required a cartridge, the reason Spectre required a cartridge , the
>reason Janus requires a card, and the reason other emulators require
>hardware of some sorts is specifically to stay legal.

Actually, the cards also serve as means to provide special chips from the other computer that the main computer does not have. Some emulators are pure software like PC-Ditto and the Xformer programs with images of Atari OS ROMS. Even if there is a card for Linux on a 486, you still can't use it on a Sparc or a SGI workstation.

>As I asked you several months ago, what alternate method, legal method,
>do you have to allow your users to use your product. Your answer so far
>seems to be "none". You have no legal standing to distribute your
>product.

May MagiC be an alternitive? Remeber, you still will have to get a copy of it on the Unix box and not give it to anyone else or put it on network(provided you bought it yourself of course). Or why doesn't Atari put TOS 2.06 on DOS formated disks? They will still get paid for someone using it and at least you know it's the real TOS itself? (Or maybe Atari may be generous to put 8-bit games on virtual disk files on a CD-ROM, no? :)

Now, I don't plan on using STonX right now. I only wish to use Gemulator 4 because I want STe emulation. And I will also have to buy the TOS 2.06 chip as well. But if this product does not do as it claims and it's more trouble than it's worth, I may have to another emulator that does work right. Oh well, at least I would already have a TOS chip and nobody else gets it from me.

It's a good read. Plenty of technical info, especially Paul Rossiter's
series. Not so much that he'll go out of business, mind :-)

They have announced a couple of shows to be held in UK.
1. Sat. 9th December '95 @National Motorcycle Museum next to the
N.E.C. Birmingham
2. Sun 10th December '95 @Marlborough Hotel, Bloomsbury St.London WC1
Both 10:00 til 17:00
There is a list of regional representatives (sic) who will try to
co-ordinate people willing to car-share or minibus-share.
These are: Phineas Pope at Merlin (Gloucester) Tel 01452 770133
Brian Stanton Tel 01292 313497
Denesh Bhabuta Tel 0161 796 5864
George Nash Tel 01207 500414
This sounds a good idea, I will be going to the Birmingham event
from Leeds. Any one else going from West Yorkshire? email address
below.
BTW Issue 7 has a double page spread about HENSA with access times.
That at least offers a possible explanation for "Unhandled exception
error.Application will now terminate" messages that I have had in
Mosaic. That, or it's a regular Windoze SNAFU ;-)

There's a GNU C++ compiler but I doubt it will run from floppy.

It isn't a case of just 'butchering' your Lattice C libraries.
C++ used to be compiled by using a preprocessor that converted it all to
plain C, but I have never heard of one for Atari.

Write one:-)

HP has a quantity of support phone numbers as well as a faxback service for almost any question you may have.... however, you should know that they have yet to release an update to their HP500 Series PCL Commands document. This paper lists the printer commands so that you can build the needed data into your own driver. The kicker is they have not documented the enhancement commands for the 600 series printers.

In a nutshell, the 500 & 550 drivers will still function with your new 600/660 printer.... but you may not be using the higher resolution (for text) until you manage to enhance your driver(s).

(I have already tried to do this with my Calamus software on my Atari platform and have called to HP several times. If I manage success to obtain this information I will be glad to share it here.)

I've had this as well. Also STIK/CAB reports errors in a large number of
files. Could this be a timing out problem?

> In a day where computing power is unbelievably fast - faster than it
> need be some argue - the old girl just doesnt cut the grade. I was a
> staunch defender of Atari - but I came to realise that we just have to
> move on...

You can still use the ST for major tasks like word processing and
e-mailing. The ST does all I need right now, I only have to get a PC
because my courses work with PC-specific languages. But I'm still going
to keep my GEM applications. Come on, if you think you need a $2500
120MHz computer with a large hard drive and memory just to type a letter
then you are a sap. I wrote many term papers on a Protext demo I got of
a coverdisk, the only thing missing is the spell check.

> The way forward is with UNIX workstations - none of your PC or Mac shite.
> For real power, good fast programs and the potetial for f***ing great
> games - the Unix workstations are the way forward. Do not let UNIX scare
> you - in this day and age there are so many shells for UNIX that it
> need not be the scary monster that it was ten years ago - it offers an
> excellent environoment to work under.

Now this what ticks me off, at least Atari users are the nicest and most
helpful of anyone in the computer world. It's these snot nose Unix users
who think that their crap smells like roses. If you guys are so good
then why does the Unix servers I use over the modem break down half the
time? Besides, Unix is only true good for true Internet connections.
It's no less a niche computer than the ST. BTW, it would be nice to have
a shell for my college Unix account.

> Please take my advice, sell your ATARIs while you still may make some
> money - I mean you only have to look at the price they are going for and

Maybe people are better off buying $400 computers for simpler things, not
these high-end Unix stations only the rich can afford(more Unix elitism)

> even the size of ST Format all f***ing 2 pages (exaggeration)..
^^

Must you flaunt your lack of common sense? You lost your right for
a proper debate.

[The higher the *'s above, the higher the ignorance of the poster]

> May she rest in Peace........the ST is dead....

Right, you'll probably download STonX on your fancy gear and try to
impress other geeks how you got an ancient Unix mainframe to emulate a
68K based 8Mhz computer.

You can only use SCSI drives for the ST. You'll also need an adaptor
like ICD Link. Here's a good rule, if you can plug a hard drive into a
Mac you can use it on the ST.

BTW, you can only use IDE for the Falcons and there is a board in Germany
that will let you use IDE drives.

>What went wrong? Can I change anything when invoking dumpemac.ttp?

Did you follow the README _exactly_? Somehow I think you missed
the part where you are supposed to start another shell or do
some other thing. The problem is that temacs MUST be loaded at
a different address the second time so that dumpemacs can
determin what addresses needs to be relocated. Somehow you managed
to start temacs from the exact same address two times in a row.
If you had followed the README and started a shell this wouldn't
have happened. If this isn't in the manual then you should blame
the guy writing the README... :-)

Personally I'm running emacs 19.29 on my MiNT-box! ;-)

: No it's not...It was created specifically to be a PD key by the author
:
: I was and am still in the FTN network echo the author of FZT supported the
: product in when the key was released.
:
: Please get your facts right.

Ok, the facts eh?

1. As at November 5 1993 BEN VAN BOKKUM the U.K. & EUROPEAN distributor for FzDt was still accepting registrations for the key (I know cos' thats when i collected mine from his bbs).

2. If you look at the so called "PD" key, it was made by the M.C.A., they are a well known cracking crew emanating (AFAIK) out of Holland.

3. Aaron Hopkins quit out the Atari Scene because of the fact (and this has been broadcast often on the net over the last 18 months) that a cracked key was circulating the world. Which is obviously this one. I dont see his name when the key is installed.

4. If you have been reading this newsgroup for the last 18 months, you would have seen the large number of complaints from people who were ripped off by Hopkins because he did not send them any keys. You reckon he's been supporting the product? The last version of FZDT was released July 6th 1992.

When did AARON HOPKINS release this key? Why did he not advise all the people who had sent him money from all over the world that he was not supporting the program anymore? Why is it that the U.K./European distributor as late as the end of last year was still taking registrations (according reports made to me)? Perhaps you can give me and others the answer seeing you seem to have a hotline to the man himself!

: Now, if to use STonX you ripped the TOS 2.06 ROMs out of your Mega STE,
: and then used something like an EPROM burner to dump the ROMs to a file,
: then yes, you are technically within the law. However, this is not how
: the STonX documentation tells you to do things. Instead, it tells you to
: use a utility that YOU provide to run on a functioning Atari computer to
: dump the ROMs to disk. Once you take that disk to your Unix box and run
: it, you now have two copies of the same software running on two
: machines. Thus your own documentation requires users to violate the one
: copy one machine rule.

As you seem to so keen on nitpicking...

The documentation requires nothing. It just states one method
which happens to be on the fringes of copyright law. That in
itself is legal and can be easily corrected now that you have
pointed it out. Your noticification of the fact could be classed
as bad manners though.

: This is no different than if you and your buddy go to a computer store,
: buy one piece of software, make a copy, and then each go home with one
: copy of the software. We all agree that is piracy. Yet we conventiently
: ignore that in the case of STonX. Two people two machine, or one person
: two machines, same thing, because chances are the Mega STE that was used
: to dump the ROMs is being used by some other person.

I would imagine it to be within copyright laws if the people destroy
their ROMs after they have copied it on disk. At least some of the
people interested in STonX would get well along without their old
(and obsolete STs) when they get STonX running on their own unixbox.

: ROMs while Gemulator is running will result in a machine hang. Thus you
: don't violate any licenses. In fact, Atari U.S. gave their full blessing
: to this scheme over 3 years ago when I was first designing the
: Gemulator.

Funny that you speak so much about this although most atari users
are outside the US. Did you inspect the european copyright laws

before making yourself silly by shrieking 'pirates'?

: What you don't have is any authorization from Atari to allow users to
: run multiple instances of their ROMs, and by today's definitions of what
: is piracy and what isn't, to require people to dump ROMs from an
: operating Atari computer is considered piracy.

I doubt whether anybody besides you gives a **** whether users
make 'illegal' copies of their _OWN_ ROMs for their _OWN_ use.
As there are no alternatives for emulating Ataris on unix platforms,
this discussion is somewhat abstract (who has lost / gained and
what?). After all, computer companies (and users with genuine
looking fakes) have 'real' piracy problems...

: It's a further black eye to the Atari community that many of the users
: in this newsgroup are blatantly discussing how they pirated their TOS
: ROMs. This is not something that looks good for the Atari community,
: will not attract new developers or keep existing developers around much
: longer, and it certainly doesn't help the few remaining Atari dealers
: around to stay in business when an amoral developer such as yourself
: chooses to do what you are doing.

<FLAME>
Are you collecting brownie points or what?
</FLAME>

I fail to see why new Atari software developers wouldn't take a new
Atari platform positively? All that is now needed is someone selling
legal ROMs as a file.

: Since you chose not to discuss this with me in private email as we were,
: I am explaining my position in public. The fact that many of the users
: of this newsgrooup don't agree with what I'm saying doesn't surprise me

That wouldn't have anything to do with how 'objectively' you'll
presented your case, wouldn't it?

: since my straight-to-the-point attitude doesn't go over as well as the
: sugar coated messages other developers post, but it doesn't make your
: product any more legal.

If you have had half sense, you would have _first checked your
facts_ and then informed STonX authors to correct the copyright
infringing part of the STonX documentation.

I now take the following ATARI related newsgroups, As I have an
STFM, STE, MEGASTE, and the Jag console and my interests are
everything ATARI then could anyone tell me of any more newsgroups
I could subscribe to??
Are there any decent mailing lists, I tried the Jaguar mailing
list that accepted me but has never sent anything out, CAIN and
AEOL dont seem to like sending me anything either :(, other
mailing lists get through though?,
So any advice on other decent mailing lists with correct
procedures to join please:), or any other newsgroups, many thanks,

Did you mix the toner, by tipping it from side to side several times?
Judging by how long you've had it, I'd do it about 10 times to get it evenly
distributed.

As far as I know they still sell some stuff. If you do order a switch box
from them, make sure you ask them to send it in a box. The first two I
got from them had either the switch broken, as in it twisted round and
round, or completely broken off. Never had any problems actually getting
it replaced, just the frustration of the wait.

From: aj217@FreeNet.Carleton.CA
Message-ID: <DHDHJ2.GC3@freenet.carleton.ca>
Source record: 157051

Hi. I have an unusual problem that has confounded me for two weeks now.

I had just reformatted my hard drive, sh204. no problem. 20 megs of empty space to play with.

Then, for no reason whatsoever, i get an error message, saying that something or other has hung, etc etc system will reboot.

then i get the "system cannot find logical drive 'c' as in the place that holds the 'boot from hard disk' command info upon power up.

fine. i try to reinstall AHDI drive c. nothing. 'drive doesn't exist'

so i reach out and touch it, its still there. i turn everything off, and start over. start the hard drive, wait, turn on atari(its a 520 with 4meg ram) and nothing. 'device 0 not responding' and the system just continually reboots.

so i forget the hd for now and use my floppy. i try to install drive c from the install disk drive selector, then drive d, then access by clicking and using open and i get that drive doesn't exist please change etc etc etc .. .

if there's anyone who has solved this problem and can help me it would be greatly appreciated.

other than just giving up on it and buying IBM . .shudder .. .or amac . .shudder.

As an ST user who also owns Macs and as the owner of copy-protected ST software from companies long since bankrupt, I say who gives a sh*t about moral or legal issues. Copy it.

That ST is going to die some day, you're not going to be able to get it fixed, so if you can keep on running the software with an emulator on another platform, go for it.

You need to reboot the drive manually from disk using the ahdi.prg. After the drive has booted you re-install a bootable sector in drive c and all should be well.

> is I only brought it last year (mistake, should have brought a Mac

I too only bought my TT last year (and it cost a fair bit). However I don't regret buying it. The only compromise I made was to buy a 486 as well! ;-) The TT is because I wanted one, the 486 because they are useful.

> or PowerMac to run MagicMac on), and the fact that there is still

The 1st generation Powermacs are going to be outdated sooner or later. I looked very hard at buying one myself - but as I had no need for a Mac, the peripheral advantages of a PowerMac didn't add up so much. True a 486 is boring - but its cheap - and I expect my TT/486 combo to do me well until there are some *decent* replacements for this generation of computers.

:-)

I've seen an ad in an old Compute magazine (1987) were they did show an
Amstrad PC running a GEM program. This had made me thought, "Wow, a PC
can have the same front-end interface has the ST, that's cool."

True, AT's are so obsolete that it makes more since to keep a Yugo than
to keep an AT. But(theorically), the new 486's and Pentium's offer blunt
brute speed for all Intel-based applications. In reality, something
might cock it up :)

Alfred,

h > the best is to use a better emulator, such as janus, which
h > (for example), gives you ten times the graphics performance
h > the GEMULATOR has.

Do you know of a site on the web that has more information on the Janus emulator? I hear a lot of references about Janus, but have not been able to find any information on it.

I've already tried Gemulator, and while it was compatible with just about everything I tried running, it felt rather sluggish in actual operation.

Still searching for a good ST emulator...

1322. HELP! text editor VIRUS??

Newsgroup: comp.sys.atari.st
Date: 1995-11-02 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <479f7t$cl8@hasle.oslonett.no>
Source record: 156922

I've been having this problem with my machine for a long time, and I have no idea what it is. I even thought it was my machine, so I sold it (and luckily got a new one pretty cheap), but it still persisted. So it's not a hardware fault as far as I can see (unless it's the SIMMs then, because I'm using the same ones as the ones from the old machine....).

It's been gone for some time now, or so it seems, because I've had programs "bombing" instead- it's become better since I removed "Edith 1.0" Acc text editor.
Anyway, the problem is this, and it seems to happen while I'm inside text editors writing (long) emails etc.... all of a sudden the cursor stops moving and I can't do anything in the editor. I can't even access the menues.

But I can still move the mouse cursor, and the spinning Fuji (Atari) symbol on the top left still keeps spinning ("Fujidesk"/"Fujiwatch" in the Auto folder). I've also installed a "screendump" CPX called "N_althelp" where you press ALT-HELP, and you get your screen picture saved as a Degas og .img file. It gives an audible "ping" twice when it does this and the hard disk whirrs when saving the file.

Well, I tried this several times, and it worked just fine!
Then I tried to reset the machine, but not even CTRL-ALT-RSHIFT-DEL worked this time. I had to press the reset button.
When I had rebooted the machine I viewed the images I had dumped and they were fine- the screen dump had worked!

So, is this some kind of virus????? Has anyone experienced similar things with their machine? I've lost a lot of hard work because of this, even though I try to do incremental saves.
As for the text editors.... I've been using "7up" for a long time, but recently switched over to "Everest" to try that one out. It's happened in both programs. Help!!!! I need to find a solution to this problem.

Chaos strikes back is *not* DM2. DM2 is AFAIK not available on the ST and never will be - it is available on PC. It keeps the "walking on squares" idea, adds a few new spells, a very small automap, but that is about it. It is also *very* small compared with DM.

Chaos is really just some extra levels for DM - as I'm sure you know (I've also got it).

There was definitely an Atari XT, there's one available here in town for
$30. There was also an Atari AT '286, called PC2. Atari also made an
amberchrome monitor for the above machines. They were available with GEM,
so they would run DOS progs on a familiar interface!

This topic has possibly been ripped to shreads - but I'll post anyway! ;-)

> I had (perhaps somewhat smugly) always maintained that my TT was better
> in all respects (except possibly in the abundance and quality of

Unfortunatly - a DX2/66 has considerable more raw power than your average TT. I have both a TT and a SX2-50, and the SX2-50 has more raw power unless floating point stuff is required.

Also most PCs have accelerated SVGA graphics cards - which put the TT's video subsystem to shame.

> somewhat smugly) that the TT bus running at what I thought was the
> system clock speed of 32mhz was far superior to the PC bus (16 bit?
> 16mhz?).

A DX2-66 will have a mother board speed of 33Mhz compared to the 16Mhz of a TT. The core CPU runs at 66Mhz compared to the 32Mhz of the TT. Also a 486 has a built in 8K cache whereas a 68030 ony has 512(?)bytes. Any decent PC will either have a external cache or this new fangled EDO memory.

Its true that the PC's ISA bus is only 16bit at 8mhz - but its very unlikely that video data is actually using this bus - as a modern PC will have either VESA or PCI local graphics.

Having said all that - nothing on my PC beats my 19" TT-Hi monitor!

:-)

>
> No one is asking you to stop development of your product. If you can
> think of a way to make it LEGAL, then sure, go ahead and develop a
> legal product.

Two points I'd like to chuck in here:

1) In many cases the TOS 2.06 used under STonX will be from a machine that is actually turned off while STonX is running. This may or may not be technically illegal - but conforms nicely to the idea that as only one copy is in use - only one license needs to have been paid.

2) I would very much support a legal option for STonX. The obvious solution is some sort of card with TOS 2.06 ROMs in. However as STonX runs on many different platforms - this is a bit impractical. The Only other soultion is some sort of TOS license from the current license holders.

Roland.

Message-ID: <47ass9$4fb@aton.abo.fi>
Source record: 156929

I broke my ST a couple of years ago and I finally found some time
and tools to search for the problem. It's the the chip handles the sync
so it should be a graphics chip? Well anyway I need to get hold of a
chip labeled:

C025915-38
JH23-020
5J2 82

or

C070714-001
c Atari 1987
-31 I10355-01
8822PPR

...or equalent. It's the one of the square 68pin chips on the machine
that's not the MMU. Well I don't think I can describe it any better than that
;-) Preferably in Europe since I live in Finland. Scandinavia would be
prefered.

If anyone has a good idea how to cram 4 megs worth of 32 kB chips
on the ST let me know!

1331. Which offliner to use on the Internet?

Newsgroup: comp.sys.atari.st
Date: 1995-11-02 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <47avvk$im2@sinsen.oslonett.no>
Source record: 156931

I finally got hold of a harddisk, and since the disk-shuffling has stopped I'm ready to set up programs on my harddisk, among them an offline reader.

The problem is that I'm unsure of which one to use. I've heard that QWK readers aren't very well suited for Internet usage since they (among other things) don't allow for long email addresses....

I've heard that SOUP readers are much better, and I've got Okami, but it's a bit too complicated for me to set up, and I don't feel like spending the next two weeks reading the user manual and trying to figure it all out. I just need something that works!

Any suggestions as to what i should use? Somebody's suggested one called "LED" which supposedly supports different standards, although I've never heard about it or tried it- anyone know where I can get it?

My host machine supports QWK, SOUP and ZIPNEWS (some PC thing I believe)

Any suggestions, experiences, comments are most welcome... thanks!

The firm is still in business. It will release D2M v2.5
next week. And now there is a french version, an english one and even
an italian one.

I heard that they will issue a new demo version 'coz the one
we can dowload on various ftp is only v1.02.

>nntp kick

Apparently, another reason can be that smtp attempts to send
direct. After a certain delay it gives up and sends it to demon to
email. Have a look at smtp timer xxx in startup.nos and reduce the
value if it is too large.

I think that spool\mqueue\sequence.seq can also stop mail going. The
value in here should be one higher than the mail. Try extracting the
bodies from the emails and posting them again.

smtp list will show you unsent jobs. This will let you ascertain if
NOS is the problem or your email software.

Actually, I've seen the Dragon's Lair "controller" program in action in
1987, I believe, at the Atari Faire in Glendale, CA. I don't know if it
was ever officially released... it was kind of strange, though, you typed
your commands (At least as far as I could figure out) and it played the
animation based on that. Really interesting to watch work, though.

I _think_ the company that made the controller was Michtron, and I do
THINK it was officially released but only in VERY limited quantities. (I
think it was in some old STart or something?)

Hi De Ho Fellow STer's!

I've had my ST's for many moons now and am sad to say I have never played Dungeon Master. I've seen it, it looks REALLY COOL, and now I want it. If anyone has perhaps completed the games and would like to trade their copy for cash (or a Video Key is you'd rather) I'm interrested. While I'm putting all of my spare time on the choping block, I guess I'm also interrested in CSB.
Let me know!

I have a Falcon with 4 MB memory, HD 65MB, TOS4.04 and a SM124 monochrome
monitor.
On this system, Nethack 3.1.3 revision D keeps on crashing.
Someone pointed out that this was due to a bug in the AES.
Do you know of anyone who has fixed this problem?
Thanks.

Where do you live? There's a re-written TOS available for some years now.
It's called "MagiC" (formerly Mag!X) and is sold in Germany by A.S.H. and
by Computer Solutions in the U.K.
MagiC is also the base for the ATARI emulator on the Macintosh, called
"MagiCMac".

(Marinos Yannikos) wrote:

>>machines. Thus your own documentation requires users to violate the one
>>copy one machine rule.
>
>You do not necessarily have 2 copies *running*.

If you buy a piece of software and then make a copy for your friend, it
might also be the case that both copies of the program are not running at
the same time. So that'd be no piracy then?

You should simply notice that the ROMs are a piece of software like any
other software from disks. ATARI sells (sold) this software as any other
piece of software is sold, too.

>What I don't quite understand is, how in the world you come to the conclusion
>that someone is a pirate, if he doesn't have an authorization to allow *other*
>people to run multiple instances of their ROMs (which they don't necessarily
>do). Frankly, what other people do is their problem. This does not mean, that
>I agree with your faulty argumentation about it being piracy.

If you take the ROMs out of your ATARI after you've installed a copy of
them on the machine running STonX, this should be legal, since only one
copy of the TOS you _bought_ legally (hopefully) can be used as directed.
But if you keep the ATARI with the ROMs intact and are even thinking of
selling this ATARI to someone else when your ATARI software runs with
STonX, you do kind of illegal.

>If that was so, all
>disk backup programs would be illegal, because you could make pirate copies
>of software if you wanted.

As Darek explained, it's the way you expect STonX users to make illegal
copies of the ROMs. And in your public statements here you do nothing to
correct this. Instead, you seem to support this illegal copying.
Anyone can make mistakes if he doesn't know it better. What Darek
complains about is that you do not realize your mistakes.
You might state "OK, I didn't know about these legal issues. I'll change
my STonX docs by explaining that people would do illegal things if they
keep two running copies of TOS - then they'll have to decide on their own
whether they want to do illegal things or not" and all would be allright.
But instead, you argue about legal issues. You may that do on court, but
as long as you haven't changed laws, you are not right with your opinions!

Source record: 156804

I think you should really consider MagiC and NVDI 3 as they are both excellent. I have both and they will revolutionise the way you work on your Atari. Most people think they won't use multi-tasking that much but once your used to it you really don't want to go back to single-tasking. As a comparison think of what it was like when you got your hard drive. MagiC also improves the speed of your machine by a fair bit and the ability to run TOS programs in a window is very handy. As for NVDI 3 it does wonders for your screen redraws although not that much difference if you have 2.5 . Together these two pieces of software make a mighty team. It will feel like you have bought a new machine.

Don't know if you will use the HD floppy drive that much though if you have a hard drive. Go for the memory if you are buying MagiC and you will certainly need it to use GCC. You mention Neodesk 4 and I can't say that I've used it but I will say that the recommended desktop Ease is excellent, although it does use a fair bit of memory. The desktop supplied with Magic is actually quite good and you may find you wil get by on that for a fair time (I used it for months before getting Ease).

Hope you find this info handy,

Simon.

1355. RFD: comp.os.linux.m68k

Newsgroup: comp.sys.atari.st
Date: 1995-11-03 00:00:00 UTC
From: Chris Lawrence <lawrenc@nextwork.rose-hulman.edu>
Message-ID: <815429623.24308@uunet.uu.net>
Source record: 156805
Cross-posted to: news.announce.newgroups,news.groups,comp.unix.amiga,comp.sys.amiga.applications,comp.sys.atari.st,comp.os.linux.development.system,de.comp.sys.amiga.unix,maus.os.linux68k

```
REQUEST FOR DISCUSSION (RFD)
unmoderated group comp.os.linux.m68k

This is a Request for Discussion (RFD) on the subject of creating an
unmoderated Usenet newsgroup called:

comp.os.linux.m68k

RATIONALE: comp.os.linux.m68k

While there exist several newsgroups and mailing lists dealing with
the Linux port to Motorola 680x0-based platforms such as the Atari
ST/TT series, the Commodore/Escom Amiga, Apple Macintosh and Motorola
VME platforms, they are either too narrow or too broad in focus:

maus.os.linux68k is a local newsgroup with postings in both English
and German. It primarily consists of German-language discussion of
Linux/m68k and crossposts from the Linux/m68k mailing lists. It does
not propogate to very many sites.

comp.unix.amiga is a Usenet newsgroup with postings in English,
dealing with all *nix flavors available for the Amiga platform (such
as NetBSD, Minix, Linux/m68k and Amiga UNIX). Most recent discussion
seems to be on NetBSD/Amiga.

The Linux/m68k mailing list at Rutgers, the State University of New
Jersey, USA, is being phased out of active use. It descends from the
680x0 channel of the linux-activists groups.

The Linux/m68k mailing list at Universitat des Saarlandes, Germany,
has taken over the traffic from the Rutgers list, but mainly hosts
discussion on kernel development.

The new newsgroup (comp.os.linux.m68k) will deal with all topics
relating to Linux on the Motorola 680x0 architecture, including end-user
questions, kernel patch announcements, kernel development, and porting
to additional systems with Motorola 680x0 microprocessors.

The likelihood of creating additional groups (comp.os.linux.m68k.*) in
the future is practically nil.

CHARTER: comp.os.linux.m68k

The group comp.os.linux.m68k will not be moderated. It is intended to
further interest in, and development of, the port of the Linux
operating system to the 680x0 architecture. It is anticipated that
```

almost all discussion in the newsgroup will be in English.

END CHARTER.

PROCEDURE:

During the next 30 days, this RFD will be discussed in the group news.groups. Please confine all comments on the RFD to news.groups.

Approximately 30 days after this message's initial posting, a CFV (Call For Votes) will be posted to these groups, including instructions on how to vote on this proposal.

DISTRIBUTION:

This RFD will appear in the following newsgroups: comp.unix.amiga, comp.sys.amiga.applications, comp.sys.atari.st, comp.os.linux.development.system, de.comp.sys.amiga.unix, maus.os.linux68k, news.announce.newgroups and news.groups. It will also appear on the "official" Linux/m68k mailing list, linux-m68k@phil.uni-sb.de.

Proponent: Chris Lawrence <lawrenc@nextwork.rose-hulman.edu>

>a disaster for Amiga-, Atari- and Acorn-users using new HP printers..
>=(Soon we'll probably see great new printers that ONLY understand
>the Holy Windows -environment...
>
Hello, Tom. Well, I would say, no it's not true. HP gives excellent
support to everyone. We just have to remember that to get support beyond
your purchase of their products you must:
1) call with relevant questions, and
2) act civil with anyone on the phone.

In my cae, when I called HP about this, I wound up having to call
different support numbers before I found someone who actually understood
what I was asking for. It was then I was informed that the 'enhanced
commands' of the newer model printers just have not been documented for
distribution.

This is not something that you, as an end user, can count on 100%.
However, if you are a full-fledged developer then that's a different
story.

>
In the explanation given to me by Karl Brandt of SYSTEMS(!) Solutions,
when I went to enquire about TOS 2.6 upgrades, there was no point
because "MagiC REPLACES TOS" - his words, and he's an expert
(allegedly). Hence I'm still using a TOS 1.06 STE, but under MagiC it
feels like a new TOS, cos it's so much more stable.

This is my understanding only....

Andrew

>If you buy a piece of software and then make a copy for your friend, it
>might also be the case that both copies of the program are not running at
>the same time. So that'd be no piracy then?
>You should simply notice that the ROMs are a piece of software like any
>other software from disks. ATARI sells (sold) this software as any other
>piece of software is sold, too.

!!! So is it illegal to use a copy of software which you have purchased??
I think not, indeed its good practice to use a copy of the original software
and keep the masterdisk(s) somewhere safe. So if you agree that ROMs are
just like 'a piece of software' then why is it wrong for someone to use a
legally purchased TOS rom image with STonX?

>If you take the ROMs out of your ATARI after you've installed a copy of
>them on the machine running STonX, this should be legal, since only one
>copy of the TOS you _bought_ legally (hopefully) can be used as directed.
>But if you keep the ATARI with the ROMs intact and are even thinking of
>selling this ATARI to someone else when your ATARI software runs with
>STonX, you do kind of illegal.

So whats your point? That potentially STonX could be illegal because people
might one day sell their STs and keep STonX???? Come on, is that really the
best you can do? Why not just say "I'm one of the authors of MagiC and
I don't like a FREE competning product" .

1370. Mutated C source

Newsgroup: comp.sys.atari.st
Date: 1995-11-03 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <815436078_OASIS_@swampdog.demon.co.uk>
Source record: 156820

Has anyone else experienced mutated C source code when posting anything containing the percent-d in the likes of printf(). This is under NOS v.042 - sometimes it just mutates and sometimes nntp causes NOS to bomb out as it sends it.

[perhaps fprintf(fp,str) in place of fprintf(fp,"percent-s",str)]

No, Michtron had a program that allowed the ST to control a laser disc player. I saw it at one of the shows many years ago.

:
: Fzdz does vt100 ? I use it on my ST for BBS'and files (no key). A great
: program. I'm using v.2.10. Is there a later version w/vt100 ?

The last version of FZD is 2.20. It does not do VT100 but just set it to
ANSI and it's nearly perfect. The PD key was posted in this group a few
days ago and was supposed to be on ST Format cover disk as well.
FZD is no longer supported but I think it's great and I use it all the time.

though you need an ST to use it.

Thats wrong, years ago a company sold Dragons Lair and a LaserDiscplayer together with a
controller and software for either an ATARI or an AMIGA.

Perhaps you can get it secondhand.

Where can you get Atari / St emulators for the PC.?

I have checked out :
http://www.halcyon.com/brasoft/

and all they have is a :

Gemulator 95 Demo for current Gemulator users (coming soon)
PC Xformer 3.20 Atari 130XE Emulator DEMO (coming soon)

i.e. nothing is available yet, as of 2 minutes ago anyway.

What public domain / shareware Atari emulators are there for the PC ?

Where can you get them ?

Where can you get games for them (which will work with the emulators) ?

The trojan light gun connects into the STE extended joystick port doesn't
it? If so, than I think it is quite easy to write a program in STOS to
use it, as the STE Extension by Asa Burrows (?) has a couple of commands
light x and light y (IIRC).

Dunno about GFA...

1388. Need help with RSVE usage (hispeed modem circuit)

Newsgroup: comp.sys.atari.st
Date: 1995-11-03 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <47biok$h4b@sinsen.oslonett.no>
Source record: 156866

I've completed and installed the RSVE circuit which lets you use
higher speeds than 19200 baud. I'm not sure about the software,
but I think I've done it right: HSmodem 6, installing
drvin.prg and mpf.prg in the auto folder.

I'm using "Connect" as my terminal program, and when I select
38400 the LED on the RSVE board lights up so it looks OK.

I tried connecting using 38400, but all I got was trash on the screen.
Now, I don't have a faster modem than 14400, but I was thinking that
installing 38400 baud as max speed would let me run the modem slower.
Am I right, or do I need to test all of this with a 28800 modem?

You must have missed Darek's message(s). The message I commented on
was posted by Darek himself.

You're right, though -- it's not worth the hassle. Darek might not be
listening anymore, and even if he did, he'd probably be the first who
changed his/her mind as a result of a usenet discussion. ;-)

Source record: 156875

I notice that a lot of people who were debating whether or not the atari platform was dead tended to be musicians. I'd be very interested in corresponding with people who use the atari for sequencing applications. Particulary, those who who use more than one program to satisfy the muse. Currently, I use Cubase, KCS Omega, and, yes, even Band in a Box to get sequence and song up and running. I find that each program has it particular strengths and weaknesses and are for most part useful modules in a total sequencing package. Are there any other Atarians that bounce back and forth between programs? Also there's the matter of machine specific editors, DA's, algorythmic composers, etc. Perhaps, this would better be addressed in a midi forum but I rather keep it all platform specific.

I am not saying that this would not be piracy. But it is not piracy to use
a program on 2 different computers, if the same person is using it. This is
true for Austria at least.

>You should simply notice that the ROMs are a piece of software like any
>other software from disks. ATARI sells (sold) this software as any other
>piece of software is sold, too.

Yes, and your point please? I've never claimed anything else. I don't see how
you come to the conclusion that this has escaped me so far.

>If you take the ROMs out of your ATARI after you've installed a copy of
>them on the machine running STonX, this should be legal, since only one
>copy of the TOS you _bought_ legally (hopefully) can be used as directed.
>But if you keep the ATARI with the ROMs intact and are even thinking of
>selling this ATARI to someone else when your ATARI software runs with
>STonX, you do kind of illegal.

What is "kind of illegal"? I'd like you to quote me a law which describes this
"kind of illegal" act. Your judgement seems to be based on your personal
feelings and not on knowledge of the laws. What you describe above may or may
not be illegal, depending on the country you're in.

>As Darek explained, it's the way you expect STonX users to make illegal
>copies of the ROMs.

I have never said that I *expect* STonX users to make illegal copies of the
ROM. It is perfectly legal to use your own TOS image if you don't use it
in the original Atari at the same time, even according to your understanding
of the copyright laws. So there is no requirement to do something illegal in
some countries in order to use STonX.

>And in your public statements here you do nothing to
>correct this. Instead, you seem to support this illegal copying.

Pardon? This is a ridiculous claim, and the only way I can understand it is
that either your English isn't good enough, or you make it because you're
working on MagicMac...

>Anyone can make mistakes if he doesn't know it better. What Darek
>complains about is that you do not realize your mistakes.

If you could kindly point out my "mistakes", I'd be happy to realize them. What I do realize is that STonX can be and is used legally, and some people are obviously interested in giving it and its programmers a bad reputation.

>You might state "OK, I didn't know about these legal issues. I'll change
>my STonX docs by explaining that people would do illegal things if they
>keep two running copies of TOS - then they'll have to decide on their own
>whether they want to do illegal things or not" and all would be allright.

I can not be expected to know about copyright laws in all different countries. In some countries it might even be illegal to look at the code in ROM with a disassembler. I think that people should generally be aware of what is legal and what not. The STonX docs contain enough information for people to know that TOS is copyrighted by Atari, so they can be expected to treat it like any other piece of software. I don't see why I should care more about this than other (Freeware) emulator programmers.

>But instead, you argue about legal issues. You may that do on court, but
>as long as you haven't changed laws, you are not right with your opinions!

I argue about legal issues? I didn't bring the subject up, but you seem to dislike my replies where I defend my point of view.

Are there any other commercial ST emulator programmers left to flame me about STonX? Hmm, I haven't heard from the Janus guys yet. Someone tell them about this thread :-/

-nino

Yes it is possible but expensive. First you will need a Link or
other ICD host adapter to plug into your Atari. Then you need and IDE
controller card that plugs into your adapter card. Then you could run IDE
drives as long as it doesn't check parity.

Source record: 156883

Hi, John!

Upgrading your STe with MagiC & NVDI 3.0x is really a clever thing to do!
I did the same with my Mega-STe 4 two months ago and got a completely new system!
If you try out this combination, you'll never want to get back to the old TOS again...

But: For a proper-working NVDI (with scalable Fonts) you will need something like
400 K of RAM, MagiC itself eats some more and if you want to run EASE (the new Desktop
that comes with MagiC if you buy the "MagiC World"-Set), you'll need another 500 K!!!
So better don't start without expanding your memory to 4 MB!

If you want to upgrade your Floppy to HD, you should buy a Disk-Drive ___with___ a
HD-Module. You can get some HD-Floppys without, but they are damn slow.

Now about your med-rez monitor: In med-rez you won't be able to use the 3D-Buttons etc.
which are offered by MagiC, but that's not the problem, isn't it?
But if you want to run the Desktop and 1 or 2 Applications in Multitasking at the same
time, your screen-size will be rather small with 640x200 Pixel. So what do you think about
downloading a virtual-screen-driver? You'll have to get used to moving a screen window
with the mouse, but after some days it'll be alright. I tried out several of these
drivers and the only one that worked with both, NVDI and MagiC / Ease was the old
BigScreen driver. It doesn't use the STe possibilities, but it's quite fast and secure.
As it is PD, I can mail you a copy if you need it.

Last thing: The DTP / Text-Processor - Programs: There are some great Shareware-Programs
around which are working fine with NVDI's scalable fonts (eg Kandinsky for DTP).
The registration fees are rather moderate, so what about trying out some of these?
I heard something like CyPress (the Text-Processor) being Shareware now, so I'll have
a look for it in Germany.

By the way: If you buy NVDI, make sure to get the new (3.02) Version as it is bugfixed.

To help you with your upgrade decision, here are some German prices:

NVDI 3.02 = about 100,- DM
MagiC World pro = 150,- to 170,- DM (this includes MagiC and Ease)
HD-Floppy-drive = about 110,- DM (one of the drives ___with___ a HD-Module)
2 MB Ram = 120,- (good deal) to 180,- DM

Well, I hope these Informations are helpful for you.
If you do need some more infos about this configuration, please feel free
to post again in the NewsGroup or mail me at
Internet: nils.tessin@mbox.iri.uni-hannover.de

I always thought MagiC had to run on top of TOS.
Of course, I'm probably wrong, as I have never used or even seen MagiC mayself.

From: allfree@scs.unr.edu
Message-ID: <47dnjk$4d0@silver.scs.unr.edu>
Source record: 156891

Hi all,

I have a few questions about CAB:

* I'm having trouble getting it to read its own sample HTML home page from the menu option, "open local." It keeps saying that it there's a read error in the file, yet it will open the very same HTML file upon loading. Has anyone experienced this? Also, when I create a seperate HTML directory, I get the same problem. I am aware that the "home.htm" file needs a few supporting directories (images, html, and such), and those have been copied too. Any suggestions?

Now, about STiK:

* I've read reports of this not working correctly. Can somebody explain to me what the problem is? Is it so bad that CAB/STiK isn't worth setting up?

Thanks in advance!

Does anyone know if GEM programs can be run under MiNT without MultiTOS running? MultiTOS is so slow, I'd rather have a shell of some sort, or maybe some replacement desktop that's not so involved? Or maybe MiNT is the slow part? I need MiNT, because I have a minix partition. Any help would be appreciated.

I am sure there are IDE adapters that hang off the MC68000, no need for a
host adapter. Does'nt the Multiboard do IDE + a few other features like
more memory & graphics adapters.

Sorry I don't have the full details, but I do remember somebody looking
for a special socket to connect an IDE interface to the square CPU in the
STE.

Aaaahhhh, a 'IDE controller card that plugs into your adapter card' ???
What is this?? SCSI to IDE adaptor??? I've never heard of such an animal and
I don't think they exist.
To put is simply, no, you can't use a IDE Hard Disk on the STe. I have
seen posts here about someone working on a IDE adaptor to run off the ANSI
port, but nothing yet.

>then emulate an Atari on it with STONX?

Exactly -- PC's can run Unix. One of the most polular Unices world-wide
happens to be Linux, which was originally written for the PC. And the
best about it is that Linux is free, just like STonX...

>I thought it was only for UNIX machines. I didn't know you could use
>it with PCs. How do you do that, or are you refering to a UNIX, pentium
>notebook?

I am referring to a Pentium notebook that is currently running OS/2 Warp
(sorry, Darek -- no Windows), and soon Linux.

Guess the fact that a lot of ST users switch(ed) to Linux where they
can get a free ST emulator now makes certain developers of commercial
emulators nervous <grin>

From: Nils Malm <t94nma@student.tdb.uu.se>
Message-ID: <47e1q8$kig@columba.udac.uu.se>
Source record: 156900

I'm about to hold a lecture on DTP-theory and would wery much like to show off Calamus capability to four-colour separate and raster an image on screen. This works just fine on my Falcon, although only in 16-colour mode.
Now i'd like to do the same thing under MagiC on a centris 660 av. Calamus works alright, but only in 2- or 256-colour mode. With 16 colours the display gets messed up everytime i try to import a colour picture.
Is there a way to fix this? Or, is it somehow possible to get the final raster on screen in 256 colours? Has anyone experienced the same problem?

/Nils

No, MiNT is not the culprit. Here is what I did and still do on the rare
occasion of having to boot MiNT: I use Wolfram Roesler's msh.prg to start
tcsh. Then, when I absolutely need to use a GEM program I invoke it through
rg.prg, a little program from Bill Rosenkranz, of which I have source and
executable. The drawback is that you can run only one GEM program at at
time, i.e. you can't multitask them. No problems with .tos and .ttp
programs, of course.

>I know it is possible but I have never found
>the right discription of it.

The original Atari SCSI adapter only supports one device. But once you've
got a replacement adapter (chose one which supports parity) you can have up
to seven devices (the eighth address being the host) connected to your SCSI
bus. Don't forget to terminate the physically last (i.e. the one farthest
removed from the adapter) device on the bus. Each device needs to be
jumpered to have a different address than all other devices on the same bus.

>Is it then also possible to connect two completely
>different drives, with a different size and speed?

Yes, of course. You can also connect streamers, CD-ROMs, scanners,
ethernet cards, what have you.

1) From the beginning the C++ would translate into C and then compile that.
This is not the case anymore.

2) It seems like all modern C++ compilers can still handle ANSI or K&R 'C'.
There is no law though, that this _must_ be so. It's more like a
"convenience".

re. Midi Networkable Games.

There are quite a few of them on atari.archive.umich.edu under
Games/Network. If you look in the 0index file, I tried to note the
manner in which the game was networkable (Midi,RS232 etc)

From what I remember it will only take 2 SCSI devices. You had better go for SCSI-1 or SCSI-2 standard and make sure that parity can be disabled. I hope someone with direct experience will be able to be more positive about this.

rgivan@cix.compulink.co.uk ("Roland Givan") spake thusly:

"G> until there are some *decent* replacements for this generation
"G> of computers.

Hear, Hear!

And do you have any prediction on when this will be? I bought my TT
this year, have lots of enhancements/upgrades in mind, and am happy
as a whole army of clams. But I can't avoid looking at the long run.
When will the screaming speed of today's CPUs be married to
simple, sparse, bug-free, user-friendly OSes? I now know that it
ain't gonna be done by Atari Corp (okay, I'm a little slow).
Does anybody else think that an advanced GEM clone on a 604 cpu
might be a step in the right direction?
Of course, right now the Gatesmeister is using his power to force
mediocrity on the mass market, just as General Motors did to the
automotive market in this country in the 1960s. But he can't live
forever.

To all of you that are considering buying monitors for use on the other side of the US/Canada border.

Beware!

Unless you have a way to smuggle a monitor across the border, it is going to cost you money or time to make this move. I just lost my remaining hair and sanity dealing with UPS and US Customs, not to mention over $100US in broker fees, etc. Call up US Customs before you buy, if the monitor is in Canada. If the monitor is in the US, I imagine that Canadian Customs will tell you what you need to do.

If the above is already well-known to this newsgroup, I apologize for wasting bandwidth. Direct flames to:

MW electronics kept promising me a better DIL to PLCC adapter for more
than one year, after which I gave up and put the PAK68/3 in a 1040ST, where
it runs without problems. The adapter needed for the MSTE gave lots of
trouble due to intermittend circuits.

^^

Oh yes you can. The before mentioned Multiboard has sockets for TOS 2.06,
graphics card adaptor *and* an IDE-interface. I think you need a adapter for
the CPU-socket but they shouldn't be too hard to get. Try Compo, they have
some for their AT-emulators.

: seen posts here about someone working on a IDE adaptor to run off the ANSI
: port, but nothing yet.

If there's a way to run MagiC under STonX without having to use any TOS
at all, then this can be a good thing. Beats the heck out of having to
install a chip only to copy it and all these postings going back and
forth about what's legal. IMHO, TOS 2.06 seems about useless(as an
interface) when your'e going to get a multitasking OS and a seperate desktop.
Magic might even bring up the speed of the emulation, no? :)

> rose kit." That's what they WANTED to call it, but they shortened the
> name to just "Win95"

Close, but no banana.

As _everyone_ now owns W95, they had no way of selling new copies of W95.
So, what they did was to package up a turd and call it "Windows For
Roses".

They had found a new, untapped market!

Hooray! "We can own the entire market!"

But, at some point during the manufacture of the product, "Windows For
Roses" and "Windows For Computers" got muddled, and ended up in the wrong
boxes.

Everyone still bought it, but noticed no difference between them.

Windows For Roses now owns 99.995% of the Rose market. Only a small,
frail old biddy in Waikikamukau doesn't have a copy of it. Bill Gates has
ordered the Panamanian death-squads to seek revenge on this heathen.

And that is the story so far.

: But if you keep the ATARI with the ROMs intact and are even thinking of
: selling this ATARI to someone else when your ATARI software runs with
: STonX, you do kind of illegal.

kind of illegal... Very well said. Many thing are kind of illegal
- not least the millions of copies of MS Windows, WinWord, etc that
people "borrow" from their work, carry to their homes, and install
there for themselves. Who blames them of piracy? It's just "personal
computer use", they say. I'd say it's so transparent, clear, publicly
accepted (!) piracy that most people who do it never even realize
they are doing something illegal... =-("Everybody does it, so why not
me too?".

Compared to this almost legalized REAL piracy of PC-world, our debate
about TOS-ROMS is really a storm in a teacup, I think. Morally and
legally people who criticize it are right - but I think we have more
serious problems to solve, too... Like how to get more software
updates as updater programs into FTP-sites. It's awfully expensive
and difficult to update (I mean smaller bugfixes) your software
from distant countries. What Gribnif and some other U.S. firms
have done, is GREAT! Thanks to them: I just purchased Geneva,
and immediately updated it into the newest version. I really
wish I could have e.g. my Papyrus-bugfixes from Internet, too.
R.O.M has done such great job this far that I wouldn't be
surprised, if they were the first (?) German firm to provide
such service. Would you hate this idea, Christian ;-) ?

> >>>>
> XT??? I think you mean XE. This is a 8 Bit Atari and they are in
> the comp.sys.atari.8bit News group. I'm sure they can help you.

Atari _did_ make IBM PC-XT machines up until about 1991. although I do
believe that some of the latter ones were manufactured by other companies
and Atari just stuck its nametag on them.

I never saw one "in the flesh", but I am led to believe that they may
have had a TV-out port.

Of course, the original message could have meant "ST" - the "S" key is
very close to the "X" key on a standard Atari US QWERTY keyboard.

1448. 1040 ST>TV Hook-up?

Newsgroup: comp.sys.atari.st
Date: 1995-11-04 00:00:00 UTC
From: lithops@neosoft.com
Message-ID: <lithops-0411950957400001@scooter-ppp-a9.neosoft.com>
Source record: 156839

I have an earlier model of 1040 ST. I THINK I have TOS 1.0(sorry, it's been awhile!)
I also have a colour and mono monitor for it, and I occassionally use it with the mono monitor to
run Mac stuff with the Spectre emulation program. Because I have the two monitors, I had purchased the Monitor Master by Practical Solutions. Although I don't have a manual for the Monitor Master, I DID find an old magazine with an add for it stating, " Has video and audio out so that if your ST has a RF modulator, you can hook it up to a TV or VCR".

Now, I know MY ST does not have a built-in RF modulator like some(all?) of the 520 ST's, so what I did was go to Radio Shack and GET a RF modulator and connect it to the Video/Audio out's on the Monitor Master THEN connect that to the cable connection on the TV, but.....nothing, no video, no audio. However, I CAN get audio when I run the audio connection from the Monitor Master DIRECTLY to an RCA jack audio input on the TV, but the video doesn't come through. CAN I somehow, someway, get my Atari connected to my 48" inch TV so's I can play Metal Master and the like? Please post or e-mail if you have any practical suggestions! Thanks!!

Some, if not all of the older ST's can have a modulator fitted
internally. If all else fails you could get hold of a broken ST and
solder that modulator in yours.

: On this system, Nethack 3.1.3 revision D keeps on crashing.
: Someone pointed out that this was due to a bug in the AES.
: Do you know of anyone who has fixed this problem?
: Thanks.

Actually, it's not an AES bug, near as I can tell. It looks like Warwick is losing his workstation handle partway through, and trying to close a nonexistant window. So far as I know, he's never gotten around to fixing it. The text version works fine (but not his graphic version running in text mode).

Not quite true. It does have the switches and everything but either due to the
power supply or the 25 pin connectors (conflicting reports on which one) there
is not enough power for both a SCSI-DMA adaptor AND termination. Hisoft supplied
me with a cable (pretty short though) that plugs into the joystick port to pull
some more power from there to make it all work so if you order from them then
make sure you ask for it. You can obviously get it from box-shifters for about
30ukp cheaper than Hisoft but none of the shifters seem to have stock and you
don't get the little CPX thing (OK so nor do Atari users yet!).

Also make sure you get a host adaptor that can handle parity like the Link 2.

System Solutions ssolutions@cix.compulink.co.uk, it is £150 and aparently operates at about double TT speed (V.Fast). There is a demo on some CD if I remember correctly it cost around 20UKP but maybe they can tell you more, please let me know how you get on as I am thinking about getting myself a Mac soon too...

>- How can the emulation be improved? Processor speed is obviously
>faste

"faste" compared to what?

This one's in German from a Gemulator user who owns a P75:

LK> 1. Packen meiner DOT Messagebase (12MB) mit STZIP2.6 (deflate fast)
LK> Gemulator: 15 Minuten
LK> ST520+ (3MB): 38 Minuten
LK>
LK> 2. in TWORD in einem Text von 251k 635mal suchen und ersetzen

635 times search and replace in a text of 251 KBs:

LK> Gemulator: <4 Sekunden
LK> ST: 8 Sekunden

4391 lines, scrolling through the text above:

LK> 3. Scrollen in TWORD; obiger Text, 4391 Zeilen
LK> Gemulator: 37 Sekunden
LK> ST: 87 Sekunden

"Twice as fast as a TT on a Pentium", the ads here say about Gemulator.
Thus an ST is as fast as a TT.

1463. CAB/STiK SLIP problems

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: samy@interlog.com
Message-ID: <47it2f$k68@gold.interlog.com>
Source record: 156704

Hi All,

I have just changed Internet service providers and the STiK/CAB does not
work with the new provider's SLIP yet it does work with the old provider's.

To make sure SLIP works properly with my new provider I established a
MintNET SLIP connection and that is fine. The problem I get is
a "Receive data (0 bytes)" dialog in CAB which never receives any data.
It does resolve hosts though and the DOMAIN.TXT file written by STiK
shows proper IP address resolution.

Since my IP address is on a subnet with netmask 255.255.255.0, I am
wondering if this is the problem - STiK does not seem to have a
way to set the netmask (or the default gateway for that matter)

Anyone have any experience they can share?

BTW, for the developer of CAB.OVL, I would like to see support for MintNet
as well as STiK - that way I could use CAB and ftp,telnet,rlogin,finger,
ping,nslookup,etc,etc simultaneously with a web browser.

* *
************************************
```

Dubble Dee Atari PD Library are proud to announce the immanent release of CATHERINE WHEEL.

Catherine Wheel is a CD that is specifically aimed at the Atari Falcon 030, but users of other Atari computers will find programmes and files that they can also use - in fact, so will users of most other computer platforms!

The CD contains:

* 130Meg of Falcon specific programmes, including games, graphic packages, utilities, MOD players, trackers, demos, utilities and application.
* 100Meg of ST/STE programmes that are 100% Falcon compatible. This also includes games, graphic packages, utilities, MOD players, trackers, applications and utilities.
* 800+ 4 (128Meg) track MOD files
* 90+ 8 (or more) track MOD and S3M files
* 20Megs of PD book files obtained from the Project Gutenberg data-base. Including greats like War of the Worlds, Around the World in 80 Days, Mars and Tarzan series by E.R. Burroughs and many, many more.
* 100 true Type fonts compatible with NVDI 3 and Speedo-Gdos 5
* 120Megs of some of the best GIF graphics you have ever seen.
* 120Megs of some of the best FLI animation files you have ever seen.

All pictures, animations, fonts and mod files have been tested on a Falcon with TOS 4.01 and 4 Megs of Ram. All S3M files will work with the shareware version of Mega-Player (v1.15).

Write today for further info...

> pirates in his eyes.

I think so too, he he posted an ad for his revamped Gemulator page I
decided to check it out using Netscape. The pictures were nice, I've
seen some screenshots of the emulators(including the one with Xformer).
Be nice if he used a screen mode that wasn't monochrome for the Gem-U pic.

It was even interesting for citing why he decided to only have Gemulator
4 only work on Win95, I agree that the DOS config files are rubbish.
However, the question & answer part seems more like a male strutting of
his product against the other emulators(including the legal ones as well).
He even mentioned that MDI and joystick ports are supported, but only in
the future will the register users will get the features. In other words
it's an advertised function that hasn't been implemented yet.

All I have to say is I will get the product when I get the chance...
However, if the product "does" work as advertised and I will get the
proper service and support behind the product...then maybe I won't need
to use an "illegal" product. Good service is the ONLY way for the Atari
market to survive.

If you want to use Edith 1.0 as an accessory, then you better give it some room of it's own. The accessory is competing with other space used by your accesories and other TSR's. Try not using the accesories that you really don't need to use(like for just typing e-mail fo example).

Or you can just use it as a program by renaming the extension as PRG. That is your absolutely best bet. Of course Edith Pro may have fixed this, but leaving Edith pretty much by itself with only a few small accesories.

I've used it for quite a while and I am very happy with it. Hopefully I will get the full commercial version. Now if it will only come with text formating and spell check... :)

I knew this a couple of years ago. Dave Troy even wrote articles about this in Current Notes. We will move towards not what computer platform to buy but what OS to use. Somebody may be able to port GEM for the Power PC, but running ST programs is a totally different thing.

That's why I couldn't buy a Falcon or any higher up Atari, since I'll end up buying a mainstream computer in the future anyways(with Atari emulation), what's the point of wasting money on upgraded what I will sell anyways? (Maybe because I can't afford a 486 right now).

Here's something that was on the Simpson's before, it's about Marge's painting of Mr. Burns(as a frail naked old man):

"He is an evil man, but this picture shows that he's old and will die soon. I like it."

Of course just barely 40 and having been married recently, meaning a strapping young heir by the time he retires, I wouldn't hold your breath.

AUD_CD20.ACC - the old shareware version of 'Audio CD Master' did audio
control of CD-ROM players. I used to use it - but I'm on the comercial
version now.

> ptc1426 does? I am interested in enlarging my display, sooner or

No - you need a multisync of some description. An ordinary SVGA monitor will do ST-Hi, but won't sync low enough for the colour modes.

I have a Microvitec multsync monitor which does all 3 modes, All TT colour modes and works as a SVGA monitor for my PC as well.

> later. But dragging my TT into the local discount store is bound to

If its a TT you have - then an SVGA *will* do - as all the modes are VGA compatible - unlike a genuine ST. I needed ST compatibility still as I still have and use an ST.

Make sure you get one with a control to enlarge the picture in the horizontal. The TT's 'VGA' signal has rather large borders!

:-)

Working on the falcon can be fun. But not when you start realizing that
you've got a falcon with a tos version wich is full of bugs! While working
with various sound recording programms the computer stalls very easily.
Now I wondered if there are any newer versions of tos for the falcon are
available. Now I'm working with tos 4.02 (with the patch programms).
So if you happen to know something about this, please let me know.

However C++ is *not* a true superset of C - so writing C using a C++
compiler can be a tricky bussiness.

Source record: 156778

] ARCShell by Charles Johnson makes lzh and arc bearable. But I second
] the above sentiments: STZip is king! All hail Vincent Pomey!

LZH-Shell, written by Christian G. The author of LHarc itself, is as with the ST-ZIP thing, basically a graphical LZH. The LZH-Shell is more configurable than ST-ZIP, but as far as compression goes, there's very little in it. ST-ZIP is better with a few large files, LZH is better with lots of small files. In both cases LZH is faster. But, with ZIP being the PC standard, choose wisely!

If the files are going from an Atari to an Atari, I always use LZH as it's a LOT faster, has a decent progress display (a spinning /|\-/ etc. isn't much of a reference), and usually produces marginally smaller archives. On an 8Mhz machine, I prefer speed if the difference is as small as it is :)

As many of you have doubtless seen that time of year is once more upon us!

No i'm not referring to the celebration of the birth of the saviour of man
but rather the Atari shows in the U.K.!

For those of you not in the know, the two shows are to take place at The
National Motorcycle Museum in Birmingham and the Marlborough Hotel,
Bloomsbury Street, London on the 9th and 10th of December respectively.

Now the time for a straw poll, who will be attending which shows?

I will, of course, be going to the London one so who might I hope to meet?

MagicMac seems very nice. I've got it, but so far have only been playing with it. It should run all correctly written software, but that doe *not* mean all software, even excluding games. Several people have used it happily for quite a time.

You need additional software to rpint though, depending on your printer.

MagicMac is amzing, as a matter of fact. I'm running it on my PB180 and the subjective speed is the same as on my TT. I also put it on a 68040 quadra. Calamus under MagicMac on this machine is the fastest DTP prgramm I'v ever seen

Especially in combination with NDVI 3.0 for MagicMac the system is perfect ! NVDI gives you the option to print with each GDOS based program on every apple printer. They do this by translating the page to the MAC OS. NVDI also lets you fonts used on the mac. Really amazing. But if you want to use a standard centronics printer there are two options: a) you can use powerprint, which is basically a serial - parallel converter. The TOS application prints with the programs own printer driver to the serial printer port and Powerprint translates it to a centronic signal - easy but relatively slow. or b) in Germany there are special Nubus cards for the Mac available which have an Atari compatible serial-, parallel- and even midi-port. These ports are just much faster then the original Atari ports.

Yes, parity MUST be disabled on any Mega STe internal drive. The
internal SCSI controller only supports one drive without modification but
it can be any size. There is also a relatively simple modification that
allows adding a second drive internally.

1494. Hard Disk Write Errors

Hi!

Does anyone have information about hard drives for the Atari STe. I have one with LINK I and it uses the SCSI 1 type devices, I have all the drivers from the disk so that is not my worry. The question I have is about a hard drive I saw at Comp USA a few weeks back.

They had external SCSI hard drives that were pre-formatted for the Macintosh computers. Does anyone know if I bought one it would work properly for the STe? I know I would have to reformat it, but I don't want to waste $300 for a 540 meg hard drive if I don't have to. Will it just reformat and then it is Atari STe compatible? I am using TOS 2.06 in an Atari STe with 4 meg of RAM. I would prefer messages to my e-mail box rather than here, but if you post here send me a message stating you posted here since I don't read the USENET groups everyday, I sometimes just logon my system with just checking my e-mail only.

Thanks!

1498. Atari Community E-mail Address Book

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: sirsmedley@delphi.com
Message-ID: <RvCnZBu.sirsmedley@delphi.com>
Source record: 156792

The Atari Community E-mail Address Book
Revised 5-Nov-95

Hello all!

This list has been compiled to provide Atarians worldwide with the addresses to contact other members of our ever-changing Atari community. There are 4 distinct sections - user groups, Atari computer contacts, Jaguar and Lynx contacts, and World Wide Web pages. Please note that addresses that are of interest to both Atari computer users AND Jag/Lynx owners will be found in the computer section.

Using this list -
I created this list to encourage communication between Atarians everywhere. If you have a question without an answer, or are moving soon and need to find a new user group, this list should help. It is also a great way to distribute Atari related press releases, such as upcoming Atari shows and new product announcements. And I would LOVE to see user groups sharing newsletter articles via these addresses! However, it SHOULD NOT be used as an advertising tool. If you are a retailer looking to advertise, please contact the individuals on the list and ask if they want to receive your mailings. Some people must pay for their e-mail by the character and would not want unsolicited commercial mailings.

If you have any changes, additions, or suggestions, please contact me via private e-mail. My addresses are listed under AUNT.

Dan Mazurowski, AKA Sir Smedley
Semi-official e-mail contact for AUNT

PS - This list may be printed and distributed at will, though I would like credit for compiling it.

1499. 520ST Newbie needs help, Please !

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: creid@ka4ybr.com
Message-ID: <1995Nov5.174344.10859@ka4ybr.com>
Source record: 156793

Hi Everyone,

After wanting an Atari ST for years and not being able to
afford one (i work on PCs), I finally got one ! Yesterday
I found a 520ST at a hamfest for $40, it included color
monitor, CPU, a double diskette drive, a single diskette
drive and mouse. It also came with a stack of diskettes
ALL of which seem to have been formatted :-(.

The diskette drives seem to have some wear and may need to
be replaced ??? They look like they might be "standard" 720K
units (I hope). The guy I got it from used it to get his
daughter computer literate :-) after he got through with it.

My main interest for it is sequencing and MIDI although there
are other things I'd like to do with it :-). I have a lot of
questions and if anyone could help, it would be appreciated !

Can the memory be upgraded ? Can it be "upgraded" to a
1040 (I don't know, lots to learn :-).

What does it take to add a hard drive to it ? I work on PCs
and even have some MIDI stuff for those, but I never get a
real chance to play there, thats the idea for the ST :-).

Is software still available for it ? I don't know if I
have the TOS rom(s?) in it, but it does come up with a desktop.
but it doesn't seem to quite match the description that is
given in the manual I got with it.

Any pointers, information, help or encouragement would be greatly
appreciated !

Thanks and take care, Vikki

1500. Brainstorm's JPEGD

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <47ja34$rqj@nyheter.chalmers.se>
Source record: 156794

A short while ago I added interface code (based on work by Panayiotis Andriopoulos) to MGIF which enables it to use Brainstorm's DSP JPEG decoder on a Falcon.
While the code works very well, I've not included it with any but my own personal MGIF versions, since I'm not sure about the legal aspects.

JPEGD itself is free AFAIK, but IIRC there was some talk, when it was first released, about some kind of developer fee. Now, even if that was indeed so, it might've been only to pay for the documentation, which I have no need for. It could, however, also have been some kind of license, even if that does seem a little strange in this case (IMHO).

So, I know wonder if anyone knows anything about this.
If not, an email address (or fax no) where I can reach Brainstorm would be much appreciated.
It would be really nice to release MGIFv5 with DSP JPEG support, but since I only write FreeWare software I'm certainly not prepared to pay any hefty license fees.

1501. Re: megaste with more than one SCSI hard-disk?

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: ua558@freenet.Victoria.BC.CA
Message-ID: <1995Nov5.203717.7448@freenet.victoria.bc.ca>
Source record: 156795

I have a Mega STe with an internal 105 meg drive. I then bought a 65 meg Atari Megafile, which connects via the DMA port on the back of the STe. This was then replaced with a FA ST ICD drive which included a tape backup. This too connects via the DMA port. If you get a non-Atari specific SCSI drive, you will need to add an ICD Link before you can connect it. The Link allows any SCSI drive or device (tape backup, CD ROM, etc.) to be connected.

1502. Problems deleting files

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <47ik78$bku@sinsen.oslonett.no>
Source record: 156796

I'm having problems deleting files that have 0-byte lengths, which
have been created for some strange reason on my newly acquired
harddisk.

I'm using ICD's "Link II" and ICD's own SCSI utilities. I have no idea
why these files have been created, and I don't see any use for them
(I've even renamed them, and no program is searching for them).

Neither TOS (2.06) or Selectric can delete them. I haven't installed
MiNT or anything like that, as I've heard that there are programs in
MiNT that can do the trick... Any suggestions as to how I should be
able to delete them?

I might add that I'm able to copy/move/rename/touch these files, but
not delete them. Strange!

Hallvard

g> Does this mean that games (and such) which are not TOS
2.06
g> compatible would work under
MagiC?

Why do you ask the unanswerable question, Gerry :)? Suppose it all depends
on the source of incompatibility..... continued
below...

g> When you say "completely replaces it" do you mean that you can
blow
g> it into EPROM & put these into the
ST?

Well... the ROMs are not accessed once the m/c is up and running but I
guess that MagiC does not contain establishment code to test RAM, set up
store tables, build device tables and initiate the primary boot sequence.
So.. in this sense you could not chuck out the ROMs and replace them with
MagiC, nor would MagiC, on its own, be able to boot in games which organise
the m/c to their own
specs.

To be honest I know sod-all about this so better shut
up.....

>
> Please tell me of your experience
>
> Thanks from
Really you should have got hold of Diamond Edge or Back a while ago so you had a mirror of your FATs or a full backup but unfortunately you don't! You could try using a program that will restore your bootsector but you may need your partitioning info but i'm not sure. Unless FAT 2 is still intact then unless you have a recent diamond mirror (which i geuss you don't) you are quite simply buggered unless you can find someone with an incredible amount of knowlede and time. Knife ST/Diamond Edge etc will be able to copy FAT 2 to FAT 1 and getting hold of a copy of D.E. ire really recomended to ALL Hard Drive owners. I don't have shares in it I just love it!

To Anyone who has written PD or Shareware for the ST,

I am begining to compile software to be placed on an Atari specific CD Rom and I understand that many people do not appreciate it if their software is put on a CD Rom, if anyone here objecs to their program being on it, would like their program to be on it or had changed their minds about the restrictions of putting software onto CD Roms then please mail me. Thanks for your help.

1507. STonX problems...need help

Newsgroup: comp.sys.atari.st
Date: 1995-11-05 00:00:00 UTC
From: digiacom@panix.com
Message-ID: <47jh3j$npk@panix.com>
Source record: 156801

Hi all......I recently obtained the ST-eumlator that runs under the
LINUX operating system....I have the source and the binaries....

I followed the rather incomplete instructions as close as possible.
I successfully dumped an image of my TOS roms from my 1040 Ste.

When I executed the program it successfully finds the TOS image file but
complains about the ST keys not being mapped correctly and then seems to
be in a state of limbo....

I've read that some people ARE using it with no probs....Can someone please
help I would be very greatful..

Lately all the STonX posts has been a FLAME war...lets stick to answering
questions posted by other users not unwarranted opinions....

1513. scsi problems

Newsgroup: comp.sys.atari.st
Date: 1995-11-06 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <47m3i6$4ad@epsilon.qmw.ac.uk>
Source record: 156657
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all

A little problem.. maybe someone here can help

None of my external scsi drives now works with my Falcon... they did
earlier today, but suddenly stopped. Now when I boot up (with AHDI 6),
I get unable to identify, or something like that. Anyone know what is
wrong.. how I can fix it etc etc? The drives wiork on my STe though.

I look forward to your replies.

Best Regards
Danny

1514. Gemini Desktop and Colour Icons

Newsgroup: comp.sys.atari.st
Date: 1995-11-06 00:00:00 UTC
From: massimo@irfmn.mnegri.it
Message-ID: <massimo-0611951550200001@macmax.irfmn.mnegri.it>
Source record: 156658

Hi!
I don't know if this is a real problem:
Why in Gemini desktop I have

Monochrome mode : B/W colour icons (1 bitplanes)
16 colour mode : 16 colour icons (4 bitplanes)
256 colour mode : 256 colour icons (8 bitplanes)
->> 32K or 65K col. mode: 16 colour icons (4 bitplanes) !!!???

With more than 256 colours I must have the previous kind of icon resolution
(256 colour icons/8 bitplanes)...
This is strange or normal ?
Thanks.

Has anybody used a decent A4 flatbed _colour_ scanner? More importantly:
Have you used on a Falcon030? If you have, perhaps you could let me know
what pieces of software you use and what scanner you use.

I would be most interested in a scanner with an under 400 Ukpounds price
mark!

TIA Simon.

1517. Help with 1040ST

Newsgroup: comp.sys.atari.st
Date: 1995-11-06 00:00:00 UTC
From: garyk@cup.hp.com
Message-ID: <47lokm$pig@hpax.cup.hp.com>
Source record: 156661

Hi -

I have a friend-of-friend, a musician, whose Atari 1040ST recently died.
I don't know what it is and he's not a computer person (and as a musician,
is poor.) He's doing some musical stuff on it and needs something
with midi.

1) Is there someplace in the Silicon Valley/Santa Cruz CA area where it
can be repaired?

2) Is it worth it? If not, is there a similar device new/used that can
replace it?

Sorry for the newbie-like questions but I don't know ^$*%(about Ataris.

email or a phone call would be appreciated!

thanks,

Gary

Actually, TT Hi cannot be achieved with standard monitors - it requires
a monitor which handles ECL signals. These monitors are harder and
harder to come by. The Moniterms used in the Mega ST upgrades
will work as will the Moniterm VY1000 used in the Bell Workstation
Graphics Engine package (that's what I have - got it for $50CDN at
a surplus store) and some old Sun mono monitors (may need sync
incversion though).

You cannot use any of the new VGA analog montiors for TThi!

I checked with someone who ought to know about these things -- a judge.
Here in NL it doesn't matter on which computer the software is run, it
doen't matter who is using the software, it only matters that no more
than one instance of the software is running at the same time.

Point 1 means that it's legal to run software in a distributed network
environment, where you can't tell on which machine the software will be
running. Point 2 means that your wife/girlfriend is allowed to use the
word processor that you've bought, when you're not using it. Point 3
means that when you're sitting in front of your ST/TT, running MagiC
or MultiTOS, it's *illegal* to start that word processor more than once.
I have to admit that I've often broken the law in this respect, and
probably will continue to do so. :-)

I tried to find out if there would be a difference, regarding point 3,
if only one copy of the text and constant data were to be in memory
at the same time (e.g. a base relative binary under MultiTOS), but
the only thing I found out, is that it's hard to explain such concepts
to a computer-illiterate. :-)

Of course it's always possible to have some special agreement (license)
with the software producer, in which case things can be completely
different (multi-process, multi-user environment).

Back to Thomas Tempelmann's example: if I can be sure that my friend
and I will not be running the software at the same time, then yes,
it would not be illegal.

Back to STonX: as long as I'm not running TOS on ST and unix box
simultaneously, there's no problem at all.

Very weird. Sounds as though it coughs when the data rate gets too
LOW!

No idea what the cause is but you could try seting the HD driver retries to
2 or 3 (you are using ICD, aren't you) or you could emuate the beneficial
effect a RAM disc seems to have by increasing the size of the input buffer
of the comms.
s/w.

Hmmm....

I get exactly the same problems with TOS 2.06 when using NOS which needs to
create these files, TOS 1.6 is fine. Kobold deletes them easily and is a top
utiltiy anyway but apart from that just load up your text ed, load the file,
type in a few characters save and delete!

To use Stik I think you need 1 meg but a floopy drive will work but not be
recomended. Stik currently only gives IRC & WEB pages-NO news, mail ftp etc For
this you will need NOS & Oasis, due to the size of rthe programs the amount of
news temporary caches etc you really need a hard drive and 2 meg is more than
recommended. I'm a bit short of time at the mo' to type more but if you need
further help please mail.

I think you'll need a SLIP internet connection, not PPP.

The programs required are STIK and CAB for web access, Oasis for
off-line reading (email, newsgroups etc), AtariNOS for the rest
(FTP etc.) - all shareware or public domain and available to download
from a good site near you...

>
>I have an STFM, 512KL memory and DSDD internal drive (720K nominal). If

More memory and a hard drive, I'm afraid - but think of the other
benefits these will bring!

Good luck

Moose, there are no pd or shareware Atari emulators available for the PC.
The two commerical emulators that do exist both use hardware, so you
can only make use of a demo if you already had the hardware in your PC.

Not to worry. The Gemulator product is demonstrated at Atari shows
around the world every few months, plus it is available from dealers all
over North America and Europe, so perhaps you might be close to one of
these dealers or shows to see the product demoed. I will be doing the
next demonstration of the Gemulator next month at the annual Toad show.

Or since you've already found the web page, look specifically at the
http://www.brasoft.com/brasoft/gem95.html page for specific information
about Gemulator, screen shots, a picture of the product, benchmark
results, etc.

Yep... it is an unexpected cost, luckily with the STs being so old get the
shipper to mark it as scrap/salvage or similar, and you end up paying $20 or
so extra.

It should be fairly easy for a competent C programmer to port one of the
UNIX sources for talk to work under STiK. I imagine that Steve Adam (STiK
author) could easily do it, but has higher priorities like getting mail,
news, ftp etc. to work first.

Anyone out there want to trade their Link II or AdSCSI host adapter in a straight swap for my boxed ADSpeed 16 STe accelerator, includes docs and software...

I'm looking for an Atari SCSI adapter that ISN'T a LINK (I already have one) which will work with a regular scsi drive, ICD's ADSCSI/plus and Link II are the only ones I am aware of.

Email if interested, i figure both these things are worth @ the $70 mark so...

Will sell if no trade-in! hehe.

In Message-ID: <951103040008214000@acpu.com>, tderrick@acpu.com, talking about his TT, asks:

>Will an ordinary SVGA monitor display ST Low, Med, and Hi, as my >ptc1426 does?

The TT uses 31.5khz horiz., and 71.2hz vertical, for all resolutions, except TT high. That includes all ST resolutions and TT low and TT med.

So any VGA or SVGA monitor will work fine.

To include TT high resolution would require one of the better multi-sync monitors. I do not know what frequencies the TT uses for TT high, but it is a much higher horizontal frequency than an ordinary SVGA monitor is capable of.

1537. small Comm program sought

Newsgroup: comp.sys.atari.st

I apologize for the obvious question, but ...
I am looking for a small communications program that has
terminal emulation (~VT100)
file transfer (X/Y modem, Z a plus)
if possible phone dialing directory
and can fit in one disk (360K).

Thanks
PS
if convenient reply to athanassiou+@cmu.edu

I said no such thing - what I said was that they still sold some stuff,
but if you ordered from them to get it sent in a box, cos my first two
were broken on delivery.

>

Whereas I just get my stereo output from my STE, or from the SCART cable
I use with the TV, which are then plugged into a pair of active speakers
- now that was worth the money. (-:

None that I know of. Sheesh... if you want to make use of the
technological 'miracle' of running Atari software on a PC you
should be willing to spend a few bucks for it. Darek's Gemulator
is a remarkable piece of software and worth the asking price to
those who need, for whatever reason, this capability.

If you wanna put up with LINUX there is indeed a freeware
ST emulator for the PC's. You need to supply your own
copy of the TOS however (2.06). It is called STonX.

Don't mind the whiny twat...

|is a remarkable piece of software and worth the asking price to

I'd advise selling the MSTE and buying a 2nd hand TT. This is what I did. The PAK3 looked great - but by the time I'd added in all the costs of fitting etc - the 2nd hand TT was a much better option. True a PAK3 could go a little faster than a TT, but the TT has many other features - not least a half decent SCSI interface. I also got a TT-Hi monitor, 8Mb RAM and 210Mb hard disk - all of which were bigger/better than what I originally had in my MSTE.

:-)

I was hoping by the end of 1995 - but won't be at least for another 18 months at this rate! ;-)

> *When* will the screaming speed of today's CPUs be married to simple,

Maybe 1997. Though I think the OS might be rather large and complex. My veiw is that computers will continue to look like PCs for some years to come - but will be built around heavy duty RISC chips with power to spare. They will also be able to run all PC and Mac software side by side. There is no reason why people couln't write extensions to allow ST and Amiga software to be used in the same way.

The PowerMac is a step in the right direction - but they are not powerful enough yet - and too much like an old Mac for my liking.

> think that an advanced GEM clone on a 604 cpu might be a step in the
> right direction?

I'd agree with the 604 - but whatever OS we end up with (it may well be Unix or NT based) - it will be able to run non native software anyway. True some hacker going to have to write the ST part - but its going to be doable.

> Of course, right now the Gatesmeister is using his power to force

Too true. Although it seems hard to understand how - MS won't be in this major marketing position for ever. Just like GM an IBM - they will fall from grace. Maybe people will get sick of Windows - or maybe some other company (say Panasonic or Sony) will bring a new form of computing onto the market which makes Windows look positively old hat.

:-)

> backup, CD ROM, etc.) to be connected.

The ICD drive will almost certainly have a ICD AdSCSI+ host adaptor inside it to drive the tape drive. All you probably need to do is replace the ribbon calbe in the ICD box so that it has an extra 50way IDC connector on it. Then its just a case of plugging in the extra SCSI drive and making sure you have the parity and termination set correctly.

Anyway thats more or less what I did. My ICD drive was actually built under license by Third Coast Technologies (AFAIK) in the UK. It had a 40Mb drive. The drive has long since been replaced - but the AdSCSI+ is still in use as the host adaptor for quite a few different SCSI devices.

1553. FREE: Midi Music Program from the author

Newsgroup: comp.sys.atari.st
Date: 1995-11-06 00:00:00 UTC
From: mfeaver@s3.sonnet.com
Message-ID: <47jmfm$9e4@sonnet1.sonnet.com>
Source record: 156725

Greetings fellow Atari users!

I have a ready to run program compiled in GFA Basic + Assembler
that is a much improved take off of the old Music Studio from
Activision/Audio Light. It is all my own code. As there is no
market for it (and some details never were finished) I am offering
it for free to anyone interested. Complete with on-line help over
the internet! There are doc files for it, and some actual on line
HELP screens in the midi player and midi event lister.

It will play/edit all Music Studio files (midi only no internal snd).
It will load/play/edit Std Midi Files up to 64 tracks and 200k.
Even plays Karaoke midi files (format 1) and displays the
words in real time.

It has over 18 screens with real time editting and display.

It will record a one track Midi File and beat out Tiger Cub
(DR T) and SMPTE Track when recording the demos
from my Roland RA50 arranger (multichan/parts).

Song Editor supports true Fortes, Fades, all midi controllers
velocity by color or chan with 3 accents, and much much
more! The .sng format is unique and old files (if saved
over) will no longer run in orig. MStudio programs.
It will also save a .sng file as a .mid (Std Midi File)!

Please Email me for details. This is no JOKE, you must
see it to believe it! I think you'd like it.

System Requirements: Atari ST or STe with 1 meg memory
and color monitor. Runs in low rez only, but internally
switches to med rez for text intensive screens.
4 files make up the program: approx. 325k
Will load and run off of floppy.

Email me at: mfeaver@s3.sonnet.com
or Post a response to this article.

All positive responses welcome.

Mark

PS I would try posting in the comp.binaries.atari group
but it is moderated, doesn't seem to active, and
moderator has too many rules, probably for good
reason?

I had this same problem a while back. There are several ways I found to
fix this:

1) The easiest - buy ICD CleanupST (or I imagine Diamond Edge may work
too). Run the cleanup program.

2) Try making a new file with the same name in the same directory.
Sometimes that works.

3) Re-format your drive and restore from tape/disk.

Good Luck!

I need to contact ICD Inc re replacement PAL's for a SCSI host adapter.
They used to have an email addres icdinc@delphi.com but my mail bounced.

Does someone have an updated address?

please email direct.

Thanks, Greg Cunningham

There are already several ways of connecting a IDE HD to the atari.
There are several commercial products available (mostly in Germany):
- the Multi board (as already mentioned)
- Hard & Soft sells a board combined with TOS 2.06 extension
- there are more which I can't remember

There is also several 'do-it-yourself' solutions, I know personally of
one described in a (again) German magazin, the C'T (can't remember the
issue and have a hard time finding out as well, since I'm working now
in Sweden, but have all my stuff, including my atari, back home in
Holland).

Apart from the HW, you'll also need either TOS 2.06 with the atari HD
driver or another HD driver (like SCSItools or HDdriver).

Have fun
/Rob

PS. Bert, als je meer wilt weten stuur dan even een persoonlijk mailtje.
Ik heb de C'T thuis liggen en als je een copie van het artikel wilt
```

hebben moet je even to volgend jaar wachten (dan ben ik weer terug)

>Greetings, Jan Dooms <jandooms@tornado.be>

I think this would be not difficult.
I don't have a MegaSTE and so I don't know how the SCSI adapter
in the MSTE is built in.
But if there goes a flat cable from the adapter to the harddisk, then
in general it is possible to attach another flat cable which goes to the
second harddisk to the original flat cable with a 'click on' connector.
With SCSI you can repeat this seven times. Important however is, that
both SCSI harddisks have different SCSI ID's. If the MSTE SCSI adapter is
a real SCSI adapter it
would recognise the second (or third, fourth..., seventh) harddisk
automatically.

May be I have told you something useful. Greetings,

Jaap-Jan Boor

I have Falcon with 4 MB memory, TOS4.04, but a VGA monitor.
That same Nethack works just fine (If we're talking about
the graphical version) on me using 16 colour mode. And I'm
not running it with MultiTOS, but singletos.

>Someone pointed out that this was due to a bug in the AES.

Yeah, it certainly has some problems.. but they appear after
the game on me, not before or while in the game.

You could of coz play the text version, it should work without
problems.

For pure Internet use I'd really recommend some SOUP reader.
QWK has some restrictions that aren't too nice. However,
I've done a QWK reader which I used to read news and stuff
when I had to be off-line (for financial reasons ;)). It
was OK for my Internet use, and it is capable of sending
to long e-mail addresses. If you want, you can get it
from micros.hensa.ac.uk from /micros/atari/tos/p/p100/kivi141a.lzh.

This reader should be easy to set up if nothing else.

Try using the zip/unzip ports instead of ST-ZIP. They work a whole lot better, and give you long file names and so forth. Available from an ftp site near you.

In order to be as productive as possible when working from home at weekends, I would love to be able to use my STFM for the PPP internet protocol over the phone, as well as a VT terminal emulator.

I will buy an RS232 modem. But I wonder if anyone can advise whether my system is big enough or fast enough to run a TCP/IP stack such as STIK, and some type of HTML browser ?

I have an STFM, 512KL memory and DSDD internal drive (720K nominal). If you have experience with such a small system, please post a reply or E-mail. If not, perhaps just a memory upgrade and/or a second floppy dirve will be enough??

The ideas/opinions expressed herein are strictly my own and are not those of DuPont. User will be solely responsible for their use.

I don't think the time line is right. Apple's desktop was there 2 years
before ATARI GEM. What I have seen on PC the PC GEM at the same time
as ATARI GEM was very much worse than what Apple had at that time.

>with. "Take a competitor's idea, claim it as our own, and make it

Yep, me too, I have been getting terrible trouble running STZIp with MagiC.
Also if I run the ZIPJR TTP with 2-in-1. It seems that using it once is OK,
but going back to use it again is very prone to crashing :-(I use LZH now
for safety. Slower and less compression but more stable.

This is not quite correct. Actually, any time a memory block is freed, TOS is supposed to check to see if there are any adjacent blocks and, if so, coalesce the blocks into one. Some versions of TOS, most notably those prior to 1.4, do not do this very well, though.

I think the possible confusion about what goes on when a program terminates results from the fact that most memory deallocation (including the address space of the program itself) occurs when a program quits or just prior to it. Furthermore, if a program has allocated memory and quits without explicitly freeing the memory, TOS frees it anyway.

TOS has no mechanism for taking a block of memory and "moving" it to another location, so the only good way of defragmenting memory is to deallocate it. You can do this by either having the program which owns the memory do it (close the files it has open, or quit it completely) or with a complete system reset.

AFAIK, it does already, ever since 3.04. You need to follow the instructions in the manual about the placement of NEOLOAD.PRG, though. Also, if you are using MultiTOS with MiNT, you will need to make other changes outlined in the manual and README file. If you still can't get it to work, please provide a more specific description of what happens.

>
> Ben Allfree

You can get a version of MiNT that works without the MultiTOS AES.
MiNT does slow the system a little, but not as much as the MultiTOS AES.
When running MiNT without the MTOS AES, you're only able to multitask TOS-programs (TOS,TTP). Which means Command Line interpreters, IOSmail, CommandLine archivers etc.etc.

You can use TosWin v.1.4 which is supplied with MultiTOS as an accessory (by renaming it to TOSWIN14.ACC), and then from there multitask your TOS-programs.
For example you can start a TOS-program (in a TOSWIN-window) and run it in the background, and than start a GEM-program.

I'll let others debate with you on the other questions but the above is fairly simple... if you own an original copy of a piece of software you are essentially given license to install and use that software on any ONE machine at a time, be that an Atari, PC, Mac or whatever via original OS or emulation. If you copy someone else's software, then that's obviously piracy.

For old software that is no longer sold or supported anywhere, legally it is still protected under copyright laws and you do NOT have the right to make copies without specific permission of the copyright holder. But realistically speaking, if it is no longer sold or supported, who cares? It's your decision.

Hello Jan! The internal SCSI interface in the MegaSTe has at least two "big"
restrictions, it cannot handle parity or more than one drive without
hardware modifications. You should be able to put a BIG HDD in your
MegaSTe though. Just make sure you can turn off the parity on the
harddrive, if you're able to do that, it should be running just fine.

Yes and no, you cannot connect more than one hard drive to the internal interface without making some modifications to the interface. I am currently running two SCSI drives on the internal interface, the modifications costed me about $50. I think a better thing is to buy the Link or something similiar, costs around $100 and you will be able to connect up to 8 SCSI devices. If you're interested in the hardware modifications needed anyway, let me know!

1581. I Have FREE STUFF for Bay Area Atari Users Group

Newsgroup: comp.sys.atari.st
Date: 1995-11-07 00:00:00 UTC
From: burtcom@aol.com
Message-ID: <burtcom-0711950828040001@mailserver.machome.com>
Source record: 156553

Greetings all.

Once upon a time I was an editor at START magazine (remember those good old days?) As a result, I've got boxes of ST software and hardware that I must get rid of before I move in mid-December. I'll give it away FREE to any San Francisco or Bay Area Atari Users Group who will come to my place in San Rafael with a pickup or large car and cart it away. The only caveat is, because I'm moving, I need to keep the boxes!

What's there? Well it starts with a 1040 STE with 4 MB, color monitor, monochrome monitor, and ends with four or five boxes of software including games, DTP stuff and more. I've got a more detailed list I'll send to anyone who asks.

You must prove to me that you are a member in good standing of an Atari User Group, and I must have something in writing stating that any proceeds from any auctions of my equipement and software will go to benifit your non-profit user group, and not any individual. I will also not be responsible for any software or hardware that doesn't work.

So please contact me via e-mail at burtcom@aol.com as soon as possible!

1584. Re: Colour Scanners on Falcon030?

Newsgroup: comp.sys.atari.st
Date: 1995-11-07 00:00:00 UTC
From: dcohen@cix.compulink.co.uk
Message-ID: <DHos33.D54@cix.compulink.co.uk>
Source record: 156556

The only flatbed scanner that I have ever seen mentioned for the Falcon
is the Epson 6500 (and more advanced models). I have it, and it works fine.

More like 600 or 650 pounds, though (including VAT). Far cheaper on the
PC or Mac, but then where can one get Atari software?

Available from System Solutions.

To be precise, I have mainly used it in black and white mode, but the few
colour scans were OK.

1585. Can I use my SCSI Zip Drive with my 520ST?

Newsgroup: comp.sys.atari.st
Date: 1995-11-07 00:00:00 UTC
From: an938@cleveland.Freenet.Edu
Message-ID: <47od8m$m4p@madeline.INS.CWRU.Edu>
Source record: 156557

Is there a host adaptor that will allow me to connect and use a SCSI Zip
Drive with my OLD 520ST? Also, I saw someone mention something about
HiSoft offering Zip Drives with special Zip Utilities for the ST. Are
these also sold separately or do I have to buy a new Zip Drive to get them?
Where is HiSoft located? And what are the properties of the Zip Drive
under control of the ST? Is it quirky, dependable or great? Etc...

1587. Oasis disk access - excessive?

Newsgroup: comp.sys.atari.st
Date: 1995-11-07 00:00:00 UTC
From: BOB@ajrose.demon.co.uk
Message-ID: <815785146_OASIS_@ajrose.demon.co.uk>
Source record: 156559

Can anyone explain why Oasis always spends so much time reading the hard disk after logging on and connecting to the News Server? Is this length of time reducing my chances of getting a succesful connection, rather than the 400 (busy) message I seem to get so often?

What should I delete to reduce this time - which costs the phone bill, especially when I repeatedly fail to access news server. I seem to spend more and more of my life kicking nntp ATM :-O

1588. Help for .tar/.gz

Newsgroup: comp.sys.atari.st
Date: 1995-11-07 00:00:00 UTC
From: ad910@lafn.org
Message-ID: <1995Nov7.230337.18989@lafn.org>
Source record: 156560

First of all, what is .tar/gz. I think .gz is gnu commpression, but is that tied to .tar or is .tar a separate thing?

I DL'd GZIP124h.lzh from Genie to try to gunzip some test files gathered from the web. It decompress to four.ttp's and some text files. But try as I might, using the cli switches before the filename, after the filename, or whatever crazy combination I can come up with, the only result I seem to get are short messages.

On trying to list, it flashes on and off screen so fast I can't read it. With some off-the-wall combinations of switches and filesnames, I can just spot the word "illegal" in the message before it disappears. Most often, the message "[filename].gz:disk full" appears and remains long enough to read it (a second or two). The "disk full" message occurs with a 10.5k compressed .gz file sitting alone on a 720k floppy with the gzip.ttp (284k). So, there are supposed to be 500+k free on disk. Since I'm relatively sure that 10.6k will not decompress to 500+k, I don't really believe the "disk full" message.

How do you use this stuff? Anybody have a clear understanding of how I can get from "EXAMPLE.N1.TAR.GZ" to "EXAMPLE.PRG, EXAMPLE.RSC, EXAMPLE.TXT,..."?

Thanks,

Bob

Oh Darek, now that you are apparently no longer the "Gemulator god,"
it seems you're a regular guy, and as such rather forgetful. Say,
wasn't there something called "STonX" -- a rather nasty freeware
product that brings ST emulation to the PC (under Linux) for FREE?

Moose, please read the threads about STon in this newsgroup, and you'll
probably find out why Darek is so forgetful. And you'll
probably also find out enough about STonX to judge by yourself if it's
what you're looking for.

>some hacker going to have to write the ST part - but its going to be doable.

Your dream machine is nigh! I've just seen that Apple is to
demonstrate it's prototype of the new CHRP PowerPC computer at Comdex in mid-
November. This is a PPC604 based machine that will run the Mac OS, Windows NT,
and OS/2. Availability is said to be the second half of 1996. It will be built
by Apple, IBM, Power Computing, and Motorola, and other major PC manufacturers
such as Gateway are also expected to follow. (source: Electronics Weekly,
1-Nov-95).
As you say, there is no reason why this shouldn't be able to emulate
an ST or an Amiga, since the current PowerMac can do this already.

I have been told that it doesn't. The IIRC the ST can only use speeds up either
90 or 120ns so personally (depending on the price difference) I'd opt for the
100ns simms but I'm sure someone else might be able to help I do however know
Fastram without extra hardware is useless!

>

The Gem 95 Demo is for those who have Gemulator 3(The DOS version). If
you wanted to try out Xformer than download 2.0 which is PD. It's not as
good as the commerical version but worth a good look.

BTW, I hardly ever believe those "coming soon" products which is
probably vaporware.

> What public domain / shareware Atari emulators are there for the PC ?
>
> Where can you get them ?

The only PD emulator is STonX, but you need Linux and a disk file of
TOS(which is the major controversy in comp.sci.atari.st right now).

> Where can you get games for them (which will work with the emulators) ?

I doubt if many games would work emulators except those that use GEM.
Someone did say you can run any game except for copy protected ones on
Gemulator 95, but this cannot be confirmed at this time.

Paul, any PD/sharware author who does not want their program on a CD has
to be the biggest fool. If you put alot of new PD stuff on your CD, then
people will want to buy it. I hope the stuff I will right will end up pn
a CD, though IMHO being on the coverdisk of ST Format is the highest
honor :)

I don't want to start a MAC vs. PC thread started but the one of the main problems I have with MAC's is the really poor video performance (for games). Have you checked out the latest Flight sims for the mac. They look like 200kb flight sims. that came out for the pc 5 years ago and anything decent only runs on TOL powermacs. BTW I have a 486DX2/80 that gets lot better framerates on DarkForces than on a PowerMac 7100/100?? (something like that) even on low res.

BTW, looking forward to the flames. ;]

1610. Parallel port backup?

Newsgroup: comp.sys.atari.st
Date: 1995-11-07 00:00:00 UTC
From: dave <dave@mbha.demon.co.uk>
Message-ID: <815740121snz@mbha.demon.co.uk>
Source record: 156694

There are several backup devices for the PC which squirt data out the parallel port, and restore it in the same way. So far as I am aware, the TT parallel port will support bi-directional traffic, so I would be interested to know if anyone knows of software for the ST/TT which will support this sort of backup.

Any ideas anyone?

No, GEMAR only talks to SCSI ports AFAIK. But IMHO don't bother with the parallel port type of tape drives - they are very slow. You've got a SCSI port! Use it! And you can take your SCSI drive to your next computer too, so any money spent isn't wasted.

A disaster for us, but not even a blip on the sales chart for HP.
It's just not worth their effort to write custom printer drivers
for the uh, "other" machines. Having struggled with writing printer
drivers myself, I can understand. Definitely a nasty job.

Hello, Simon, I use GTLOOK II (software) on my Falcon. It directly drives Epson Scanners of which I have and use the ES800C. It's a nice combination and will scan B/W (IMG), Greyscale and 24-bit colour.

I'm not sure of the exchange rate between us, but my package of both the hardware & software came to about $1,000 US around a year ago.

From: von@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <47ott7$66c@idefix.eunet.fi>
Source record: 156575

Hiya Gurus!

I seem to have an interesting problem ...
... I assume this is caused by some bug in Gnu Gtar
for MiNT ... I at one time downloaded the Source code
for Linux68k ... An untarred it to my hardrive ..
.. Now I wanted to get rid of the whole shamble ...
... Not that it isn't a great bunch of code ...

however .. First off a great big thanx to whoever
made that archive and write-protected all the files...
... Took me an hour to un-write-prot them ...
(.. Aren't there any proggies out there that'll do an
unconditional file delete? Regardless of Write-prot?)

Now, As I had deleted all the files, there suddenly remained
one that TOS would not delete even if I set it to Read/Write,
Fair Enough I thought and made a dash for a disk-doctor...
... Zorg v.1.95 which told me that the file began at an unused
sector ! Yipee! However, i could still not delete it... :(

So I dug around in a few Ftp sites and fond a nifty proggie
called "Shredder" which was suppoused to erase every trace of
a file from the Hd ... However it would not delte this
now a real nuisance of a file...

So I need help!!

Are there any proggies out there that'll just erase the FAT
entry for a file without giving a hoot about where it Begins/
Ends or for that matter exists?

Out Of Options...
-Peter.

I've always been under the impression that the ST type parallel port fails to implement all the lines that a PC backup device is expecting. I know that the DE600 parallel ethernet interface is built onto the cartridge port because of this limitation.

Quite honestly its a lot of effort to sort the problem out (and to write decent drivers) - and as the Atari has several decent SCSI implementations there is not a vast amount of incentive to fix it.

All IMHO and AFAIK,

:-(

Roland.

Hello to all Falcon demo authors (and others...). This post is somewhat of a challenge to you. No, I haven't written a megademo to end all megademo's, I'm challenging you to take the wonderful skills you have used in writing your screens, and turn them into screen savers or wallpaper utilities etc... for your favourite computer (meaning the Falcon).

Of interest would be 15/16bit colour plasma screens, Z-buffered/texture-mapped 3D vectors, DSP texture-mapped tunnels, and any other weird and wonderful effects you can think of.

I guess you will have all the source for your screens handy. All you need to do is write an .ACC or .CPX that can be a front end for the screen saver, and have that call a rout saved in a SAVERS directory or something.

I hope you think this is a good suggestion, as it would be good to have the great effects that you guys(and gals) have written, accessed via a screen saver. It would need to run on VGA screens, and NOT be memory resident. Forget MultiTOS, its too slow to try stuff like that.

Oh, and don't forget music too!!!

Hope to hear from you...

Chris Wilkinson.

1627. Help getting EPS out of Pagestream 2.2

Newsgroup: comp.sys.atari.st
Date: 1995-11-08 00:00:00 UTC
From: meikm@gramercy.ios.com
Message-ID: <47pcoo$mt2@news2.ios.com>
Source record: 156582

The files i created with the 2.2.11 version of the postscript output could not be read by any program on the mac or PC that I tried. Why? Illistrator said asphaltdict bad command. I was assuming that the epes files that I got from saving to disk would import easily. Alas, it is not the case. Any help please would be nice. For the most part my simple questions to this newsgroup go unanswered.

Andrew Rose (BOB@ajrose.demon.co.uk) wrote:
: Can anyone explain why Oasis always spends so much time reading the
: hard disk after logging on and connecting to the News Server? Is this
: length of time reducing my chances of getting a succesful connection,
: rather than the 400 (busy) message I seem to get so often?

Why blame oasis? It's NOS that you're using when you log on. As for the time my guess is you've subscribed to a lot of newsgroups and NOS is just comparing the news available with the news you've already go in order to work out what to download.

: What should I delete to reduce this time - which costs the phone bill,
: especially when I repeatedly fail to access news server. I seem to
: spend more and more of my life kicking nntp ATM :-O

Access failures are usually due to Demon's system being unable to cope with the number of users logged on at the time.

I'm not sure what you can do to improve things. Give Demon support a shout and let us know what they have to say.

Best wishes

Neil

Source record: 156593

- Arnel Developments -

Arnel Developments is the brainchild of a student with too much time on his hands. It arose due to the current state of the Falcon030 games scene. Whilst there is a steady trickle of PD and Shareware games being produced, most of them have been sadly lacking in gameplay (with a few notable exceptions of course). The idea behind Arnel Developments is to bring together those people who have the imagination to come up with brilliant game concepts with those people capable of programming them.

So, if your interested, take a look at the following projects up on the planning board. For each title, you'll find a quick description of the game, along with what we have already and what we're looking for to get the project rolling.

Tryst in Rhapsody

A one or two-player 3D shoot-em-up for the Falcon030. Fighting against either a computer controlled opponent or a friend, this is an arcade game that'll need lightning reflexes.

The game design is complete, and a few technical decisions have been made. We can also take care of the 3D object design, and there is very little 2D art involved.

Required:

Programmers
Experience in producing fast 3D engines essential - this game will probably be pushing the Falcon hardware quite hard.
Musicians and Sound Engineers
For an idea of the musical style for the game, listen to "Precious Things" by Tori Amos. The game will also need some stunning sound effects.

StarGate 2000

A game to rival Defender 2000 for the Jaguar. Snazzy True-Colour graphics, action by the bucket-load, and an addictive hook many games just fail to create.

The programming side of the game has already been taken care of - the game is up and running, albeit in a basic form.

Required:

Graphic Artists
Musicians
Sound Engineers

If you can help on any of these projects, or if you would just like more details, please get in touch with me.

Also, if you have a Web-Browser (preferably something like NetScape - I haven't tried it with others yet) - point it at:

http://www-users.informatik.rwth-aachen.de/~neil/ad/

There's a ton of info there - in fact, this post was nicked from it!!

Thanks,

Neil.

>Magic might even bring up the speed of the emulation, no? :)

Some people have discussed this in the German Maus-Newsgroups. There appears
to be a way to use MagiC burned on EPROMs instead of the TOS-ROMs. Can anyone
try it with STonX? (i.e. take this MagiC-Image and try to use it instead of
a TOS 2.06 image with STonX)

From: Jan Dooms <jandooms@tornado.be>
Message-ID: <47r7v0$icd@tornix.tornado.be>
Source record: 156604

No, not really, it does not really matter what
speed the SIMMS have, but an STE can only
use speed of 150 ns (very slow) so it is
unuseful, buying 70, 80, 100 ns!!!
Only with a TT or a PAK68/3 or a Falcon 030
you can put up to 60 ns.!! (very fast).

Greetings, Jan Dooms. <jandooms@tornado.be>

Hi, I have an STFM 1024 and am looking for a hard drive for it. If
you have one to sell or know anyone who does, post a message here or e-mail
me at TGRAFF@HR.HOUSE.GOV. If you live in the DC area, you can give me a
call at 703-528-7235. Thanks!

megs?
w> A response would be greatly appreciated.
THANKS

I have used 120ns chips in a store upgrade to a 520STM. This is a similar 8Mhz machine so you should be OK. I also tried a special mod. to increase the number of banks on an ST - this introduced a 50ns delay into the store access cycle and "just" caused failures to start happening so I'd guess that 8Mhz machines can tolerate RAM up to about
150ns.

Having said that you should not find there is much difference in price between these SIMMs nowadays so, if there's damn all cash difference, why not play
safe?

From: ae@yin.kuai.se
Message-ID: <47rbv9$r1p@bundy.mdk.se>
Source record: 156608

```
: Can anyone give me more information about a rumored TOS bug in the
: Falcon030, which is the reason the 640x400 resolution must be
: interlaced? I'm not understanding why interlacing needs to be done at
: all. I was told also that getting a VGA monitor means I won't have to
: use interlace? How can my Falcon tell the difference? What is all this
: interlacing about? ;)

It's not a TOS bug at all, but has to do with the horizontal frequency of
RGB/TV screens of 15khz, whilst VGA has 30khz. That means VGA screens can
update twice as many scanlines at the same time as RGB/TV.

To have high resolutions without interlace you simply need a VGA/MSync
monitor.

After a while of experimentation, notes and queries:

1 - What exactly is new - documentation doesn't say
2 - STIK seems to remain at v1.07
3 - CAB/STIK now accesses sites I couldn't previously get
4 - But seems to crash more - 2 bombs or 68000 exception
5 - Any hints or tips?

BTW I've partially replaced bits and pieces of my 1.07 setup, then
tried erasing my old cache. Crashes seem more common ATM. Could do
with informed comment on update.

With baited breath.....

Andrew

Not to be rude - but why not challenge those remaining Falcon coders out there to write a Netscape clone!

Yes, I know there is a browser for the Atari line but from what I've heard its not enough...

Challenge those coders to write something useful for a change. For without a reliable, full-featured browser, the Atari line is cut off from the present and the future of the marketplace.

Just my two cents - after all, how many rasters can one take???

azog@gti.gti.net (azog) wrote:

>Sounds great! First question is, will it run on a Falcon?

>... or better to upload it to Hensa and umich.

Don't know til we try! Never beta tested on anything
newer than a 1040STe. I don't have hardware details
on new computers. Program does address the Midi
Chip directly and accesses video at base address
supplied by XBIOS(2) for direct 'draw to screen'.
Midi interrupt vector is derived with a BIOS or XBIOS
call. If that or those things haven't changed on later
machines or the Falcon specifically, it should run!

Is anyone running GFA compiled basic on a Falcon?
If that doesn't work, then my program might not either
due to GFA libraries, etc.

I don't know anyone locally with MEGA's or Falcons.
Couldn't even get a Demo on a Falcon which I was
seriously interested in. I had heard it had 'more
pixels and colors' maybe VGA graphics capability,
not to mention a ton of other neat stuff! If graphics
hardware and drivers have changed considerably,
my program is likely not to work, and I don't have
the info to 'upgrade' it.

Feedback anyone?

Macs have training wheels that you can not take off. I am not a real fan of any windows environment, but at least with a pc, I can actually exit out of windows and have a command prompt to get some real work done.

> I have some Notator Logic files created on an Atari ST that I would like
> to convert for purposes of reading on a Power Mac. Does anyone know how
> this is done? Please respond.

If we assume for a moment that the files written by Notator are in the same format on Atari and Mac then the simplest way to get them on the Mac is to write them to an IBM formatted disk which can be read by both machines (You need to run Apple File Exchange if you're on an old version of OS).
The next hurdle is to get Notator to read the files. It may do so immediately, if it takes the trouble to try and read the file. However, it may just examine the resource of the file and decide that it doesn't like the file type and creator labels and therefore reject the file.
To solve this you can use a program to edit the resource. My favourite is Attributes which can modify any number of files you drop on it, simultaneously. It's shareware and available from Info-Mac sites.
Before you can do this you need to find the type and creator codes thet Notator uses. Take a valid file produced by your Mac program and drop it on Attributes and it will reveal what the codes are. Then just edit the imported files to be the same (they are case sensitive) then you should be able to read the data.

Hope that helps, Alun

I, too, have been tearing out great big gobs of hair on this one. If I can transfer my PageScream output (maybe via modem)to a print shop that understands pc and mac, but not Atari, I can distribute our Boise Atari User Group's newsletter with less hassle and more hi-tech. The one time that I tried it, my friend at the print shop reported that she put my disk into a "translator"(?) and what came out was Arabic or Martian cursing. Please, please, please answer this one publicly, and let us all in on it, oh PageSTream gurus. And remember that I am an idiot; please walk through the printer setup, save file dialogs, and what to tell the print shop on how to handle the file,and whatever other data a cretin like me would need to know.

BTW, I also have been unable to get sorted out how to build our "manual size" newsletter with the automatic page numbering feature working. This is because I can't seem to get the difference between "paper size" and "page size", and landscape and portrait printing combinations setup to do this. I came close once, but forgot how I did it. If you could answer this one with step by step instructions, I would be eternally grateful, and would refrain from contributing to the pc versus mac flame wars that just flared up again. (:-)

If this doesn't hold the record for the longest thread, narrowly beating
out Atari...Pride?, then it surely holds the record for the least content!
I guess we all know now, what it takes to get everyone's attention, eh?
Why don't we hold a referendum? Let's all campaign and vote as whether we
want to leave Atari, the best computer in the world, and form our own
independent platform, where we can all speak Unix! That sort of thing
seems to have people's attention here in Quebec lately.

I doubt if editing would work. I can delete zero-length files with my
TOS 2.06 no bother. So it's not the size that's the problem.
I *have* seen undeletable files before - the cause was double entry of the
filename in the directory, with one of them marked "for delete".
This condition should never arise with legal file operations. It can only
happen with software bypassing the Gemdos calls to manipulate temporary
'work' files at high speed. And it's most ikely to corrupt your disk!
I would suggest cleaning up with ICD's Cleanup or Diamond Edge or similar.

Replace the first Letter with a disk-monitor to ASCII 229. Now only some lost cluster had been left in the Fat. (On an MINIX-System, this would not help, of course!)

Ciao, Markus

Sounds to me like a "god" has fell off his throne. Standing behind your product is one thing, but this is more like typical strutting(My emulator's bigger than yours!).

I was going to get Gemulator 95, but apperantly it's bad enough when buying a PC you have to give money to the world's richest man who only cares about having control of the computer industry and not addressing the needs of the consumers.

To be perfectly honest, I really don't need a 486. I can just upgrade my current ST system which is cheaper by the way. If I want to play the latest games, I'll buy a Jaguar(better be plenty of good games Atari!).

The only need I would have of a PC is for the computer courses I have to take, I can just as well get a second-hand PC and get a RGB card to hook up to my Atari monitor. And now, I really don't need Super VGA graphics... Geoworks will be enough and it's availible as a shareware demo BTW.

I try not to say anything person about Darek, after all he is trying to sell an emulator that requires seperate TOS chips even though some guy has a emulator and the means to get a TOS image for free. But after reading his postings and his web pages, I'm afraid I cannot buy Gemulator or any of his products.

Isn't it sad that what little remains of the Atari business is the most helpful and friendly while those involved with the PC industry are just plain heartless.

I stand corrected, the Apple desktop came out before the GEM did. I haven't realized that until a bit after I already posted. BTW, the words above quoted were from somebody else's posting and I said how rotten it was. What I ment was that Apple took the GUI idea from a Palto Alto company that used to produced the Antaries computer. Apple brought the idea into home computers but did not exactly conjure it up from thin air themselves. The reason why IMHO that the lawsuit was stupid is b/c it made the PC's even harder to use. But I applogize with I misled anyone.

>
> >with. "Take a competitor's idea, claim it as our own, and make it
> >better"...gee, isn't that how Micro$oft does business?
>
> Certainly Microsoft always claims it was their idea (the mouse, the desktop,
> multitasking,...), but did they ever MAKE IT BETTER??!??!

It's funny how Microsoft tried to make Windows 95 more like the Mac(the unneeded shutoff function was a hoot!). The only true original idea was the Start button which launched application and documents, but I suppose they got the idea elsewhere. After putting up with the medieval DOS prompt and the Draconian Windoze interface, is it any wonder PC owners call Windows95 a mircle? :)

Oh BTW...on the NBC special about Bill Gates, they did show the GM of Microsoft at a "prep rally" who did say they should go out and take other people's ideas and make it the exculsive property of Microsoft.

The PowerPC is the right machine for a multi-OS platform. The only
reason it didn't fly is because IBM had not come out with a machine that
does on-the-fly x86 emulation like the PowerMacs did with the 68K code.

Now imagine this...Apple comes out with a Power PC machine that has DOS
emulation, a seperate 486 card! Man I love the PowerMacs, they don't
crash and aren't as slow as their Quadra counterparts. But Apple and IBM
better start getting together on x86 emulation in order to seriously
compete with the Intel platforms.

But even if PPC does become the standard, I'm sure Microsoft will want
only one OS to run on it...THEIRS!!

But it can't last forever...

1689. Atari Emulators for PC

Newsgroup: comp.sys.atari.st
Date: 1995-11-09 00:00:00 UTC
From: richcsst@crash.cts.com
Message-ID: <47sh95$8mf@news2.cts.com>
Source record: 156510

Yes, I am aware of STonX and Gemulator. However, I wish to know if there are any TT emulators out there??? Also, how is Gemulator (ie: software emulation) in comparison to hardware emulation in terms of speed and compatibility? Price is not my concern. I used to have a Falcon with accelerators for the CPU, bus, and DSP and I really liked it (it suffered an unfortunate demise due to a defective Radio Shack power cable). I know that Falcon emulation is a bit rediculous to ask for on a PC, but TT emulation really should not be that hard.

A hardware or software 68030/40 based demulator is what I am looking for. Any suggestions?

Rich

Just to interject a bit of trivia....

Software "license agreements" are not legally binding. Ask any attorney (not currently employed by a software company), judge, or investigate it for yourself in the law books. No contract or agreement is allowed to curcumvent the law or make additions to the law or redefine the law in any shape or form. Extra restrictions placed on software are not legally binding unless the user is 1> informed of the agreement before finalization, 2> The user agrees and signs the agreement at the time before currency transaction, with a witness, 3> Nothing in the agreement changes the meaning of copyright law, but only makes more restrictions.

These so-called license agreements are merely put there to intimidate the unknowing user. The "license agreement" is contained WITHIN the packaging and therefore is rendered invalid if the seller accepts legal currency for its purchase.

Keep in mind, however, a lot of these license agreements are merely reprints of already established copyright law and treaty, and are only reminders.

Also, registration of software (in order to make it operational) AFTER the purchase is completely illegal in the USA. However, Shareware registration is legal because the product is purchased via the registration. "This Note is Legal Tender for All Debts Public and Private" means the government says any further restrictions imposed upon the purchaser AFTER the purchase (inside the box) do not count or apply and are illegal. Why illegal? It would constitute none-acceptance of "legal tender".

Moral - Software license agreements within packages make great paper airplanes!

Hi gang.

When I had my account at Bradford I regularly "hung out" at a.a.u.e,
Hensa, uni-kl, ftp.demon, sunsite and others.

However nowadays (I am sure this is nothing to do with Demon) I can
never seem to get onto any of my old favourites.

Hensa: very limited use to non .ac.uk users

Sunsite (Imperial College): not updating A.A.U.E. mirrors

A.A.U.E: Available connections are always in use

Wuarchive: " " " " " "

Uni-Kl: very slow connect from Demon, and not much new stuff

ftp.demon: Apart from being dead ATM it has not been updated since
Frank left. Even then it only had a limited range of files.

So can anybody recommend (or start!) an FTP site that is:

1) Easily accessible

2) Regularly Updated

3) Fast to connect to

and that's about it.

Thanks.

> 1.02).

Hi David,
I don't think you can get it restored after this crash, but maybe you could try Diamond Edge. I recommend you to buy Diamond Edge - it also contains the possibility to save the SCSI-information and Diamond mirror can be set to mirror the FAT every now and then. This means that you won't loose as much if it happens again. Also, do backup the hard disk.

Good luck anyway,

Claes

Hi Gerhard,
C-lab in Germany do have spare parts for the Falcon so why doesn't the service center ask them?
If you need their address/phone/fax I can give it to you, but I don't have it at hand now - it's at my work...

Best regards,

Claes

> 1. What ST do you recommend? They're all pretty cheap second
> hand. I don't mind fiddling about with one 3.5 drive, so
> should it be 520 or 1040?

To run Cubase, you need at least 1MB, so the 1040 should be the least you can use. If you want to be able to upgrade the memory easily, get a 1040STe - the memory is expanded with standard 30-pin SIMMs in the STe.

> 2. I'm soon going to be fed up with arranging on Cubase and
> then dumping onto the Fostex for the analogue stuff, so
> I'll be hoping to sync the 2 together as soon as I can
> afford it. Recommendations on syncing please.... I've used
> SMPTE a little but how expensive in the clock/generator?
> What's a sync box? How much is that? Help.....

Why dump the synths to tape? Use one track as a sync track with SMPTE or some other time code. That way you can make changes in the music after recording audio on the 4-track. You loose one track, but it's worth it -trust me!
SMPTE is the sync that's most secure, but other sync boxes usually work fine too. When using sync, you'll always have a very good quality of the sound of the synths - just because they're not recorded on tape until you make the final mixdown.

> 3. What ancillaries will I need, MIDI cables etc.? Will I have
> to get a MIDI interface for the ST to connect with the synth?
> Does the ST already come with one?

All Atari ST/STe have midi in/out, so the only thing you'll have to get is the midi cables.

Good luck!

Actually, there is a backup FAT on the disk. Sometimes that one is intact.
You can recover it using a tool like Diamond Edge.

I don't know much about the AHDI kit but don't you have to configure the
driver using AHDICONF to tell it what drives you have
where?

Maybe the format program requires partition information before you set it
going - did you tell it how to divide the disc
up?

Yes but surely you can see that it's all you penny pinchers who
subscribe directly that are forcing the newsagents not to stock the
mags.

If you want to see Atari mags on the shelves, then start buying them
from the newsagent, rather than cutting him out.

1705. Re: Help getting EPS out of Pagestream 2.2

Newsgroup: comp.sys.atari.st
Date: 1995-11-09 00:00:00 UTC
From: damms002@acpub.duke.edu
Message-ID: <47tf7m$71q@news.duke.edu>
Source record: 156526

I encountered the same problems as you using EPS files coming from the bridge modul in Calamus SL. The problem is that EPS is not EPS .. or better that illustrator EPS is not fully EPS. Most Mac programs use only a minor portion of all commands possible in the EPS language. And many programms get easlily screwed up if there are too many waypoints.

But, utilities to the rescue. For the mac there are two utilities out there: epsconvert and epsfixer. One is to transform all kinds of EPS files into Illustrator EPS and one is to fix and mainly simplify EPS files by getting rid of unnecessary way points.

I managed it to read Calamus EPS files this way. but not all. I have no Idea why some files can be fixed and some can't.

So, give'm a try.

Thomas

IN>supplied by XBIOS(2) for direct 'draw to screen'.
IN>Midi interrupt vector is derived with a BIOS or XBIOS
IN>call. If that or those things haven't changed on later
IN>machines or the Falcon specifically, it should run!

It hasn't changed on a Falcon, but writing directly to the screen will
probably cause problems, because Falcon has more video modes than the
ST. Better is to use VDI/AES-call instead, but that will take more
time :-(

IN>Is anyone running GFA compiled basic on a Falcon?
IN>If that doesn't work, then my program might not either
IN>due to GFA libraries, etc.

I'm still using it om my Falcon, but if it will work with the version
of GFA, you're using depends on the version. I know GFA 3.5 doesn't
run on a Falcon. Version 3.6 only has some troubles with LPRINT
(doesn't work at all), but that can be avoided by using OUT 1,byte|...

IN>Feedback anyone?

If you want to know, you could UUENCODE your program to me.
If you're doing so, please cut it into peaces fo less than 14K, that
will save me a lot of work :-)

What quantum drive do you have?

Does it have parity & have you set it to off?

Are you using Supra tools, these are not great for formatting as the last version I have does not list most modern disk drives. You have to enter the drive data manually. Are you doing this?

At the present time (I think) Diamond Back is up to ver. 3.60 At least I
got the patch file called db360pat.zip for the Tape Drive types that use
my BBS. There was a major upgrade at 3.50 (money), but the only changes
were to tape backup support, so I stayed with the older version. I use a
Syquest 105Meg (actually 110meg) for backup. If you haven't got to 3.50
you might think about popping for that version and then doing the upgrade
to 3.60!

Source record: 156537

I have been using a demo of an accounting program called BIZ, which I got off of a local BBS. I like it and would like to register if it is shareware, but there were no supporting documents with the package stating whether or not it was shareware, a commercial package or what.

Does anyone out ther know anything about this program?

Hi Denesh,
Could it be a problem with your SCSI-termination? Sometimes everything seems ok
for a while, but then it all breaks down. Check that only the last drive is
terminated - and that it really is! It seems that it's less sensitive on the
ST/STe than on the Falcon.
Otherwise it could be a hardware problem with the Falcon :(
Did you run a special program just before it happened? I've read somewhere that
it's possible to disable the SCSI in the NVRAM, but haven't had it confirmed by
Atari. You could try using ResetNVR to get the factory settings back.
I hope you'll get it right.

Good luck,

Claes

Hello there,
Try Kobold - it usually takes care of ANY files when you can't access them from
any other programs. Kobold can be dangerous to use sometimes, but it's very
efficient (commercial, but it's worth the money).
You could also zero the partition, but it's no fun making a backup on disks if
you've got a large hard disk...

Good luck!

> Zip Drive under control of the ST? Is it quirky, dependable or great?

Hi George,
You should use Link II and everything should work fine. HiSoft in UK offer the extra utilities that allow you to write protect, password protect, software eject etc, but only when buying a new Zip from them -it's not sold separately. I will probably get my Zipdrive from HiSoft tomorrow, to use it with my Falcon, so I can't tell you much yet - but it sure seems great, or I wouldn't have ordered it in the first place.
I trust the Zip more than the new Syquest EZ135. Mostly because I've heard of many people having problems with the new Syquests (270MB) and their 135-model still uses the same technology that they have the past 10 years or so. Iomega Zip has a more modern 'feel', and the technology behind it is more modern so I believe that the Zip will get the best part of the market.

Have a nice day,

Claes

Ataris can read and write ms-dos disks and can also format them with the correct formatter. A Mac can also read and write ms-dos disks, using File Exchange in former times.

This looks like your best bet. There's no way an Atari can read Mac disks, although there was a MAc emulator for the Atari than had a means of doing it. I don't know if it is still available or what it was called.

Source record: 156544

You will need to use disks formatted on a PC as 720kb and then they can be used by your Mac - Why? Because the Mac's system 7.5 PC-Exchange program will only let you format PC disks as 1.44meg disks which your Atari STe can't read without extra hardware (i.e. a 1.44meg floppy mechanism and a HD disk controller).

The Atari based Mac emulator that you mentioned (Spectre GCR) was able to read MAC formatted floppies because it actually used extra hardware (an 8bit CPU - Z-80? to simulate the disk timing and read/write patterns).

I don't see why you say that there is not much new stuff on Uni-kl.
Together with ftp.uni-paderborn.de and ftp.cnam.fr is this one of the best
sites around.
Yes. Uni-kl is sometimes slow but if you rings on the late evening it
is quick enough.

Hello Marcel,
All TOS versions are more or less buggy, but the latest one for the Falcon is
4.04 and that's the one you should use. I've heard that C-lab are developing
TOS 5.0, but it's not available yet and I don't know anything about the things
they'll change in it.
You should be able to get the 4.04 from your local Atari dealer.

Best regards,

Claes

> I am asking because I want to put a BIG hd into my Mega STe.

Hi Jan,
As long as you can disable the parity check on the drive there should be no problems. I don't think there are any restrictions of the size of the drive itself, but there could be a problem with the size of the partitions. Normally everything works up to at least 256MB when partitioning with HDX. Other drivers like ICD, SCSI-tools and HDdriver normally work better.

Good luck

From: dean@sterbbs.nl
Message-ID: <804130312901@sterbbs.nl>
Source record: 156633

Hi All,

I have Diamond Back III (registered) and a SCSI II DAT drive running on my Falcon (with TOS 4.04). They have been working together wonderfully. The speed of a DAT drive is fantastic but I've just done a backup using the append function of DB III and I can only restore a few (if any) files before the DAT drive and DB III just hang. They seem to create an empty file after a couple of files and then just sit there. No time out message from either. Once though it managed to restore a whole partition (the most useful one fortunatly). I've never had any problems before I used 'append'. Anyone got any ideas?
Thanks in advance.
Bye bye!
Dean

1735. Old Superman pinball game

Newsgroup: comp.sys.atari.st
Date: 1995-11-09 00:00:00 UTC
From: zwarts@idirect.com.ca
Message-ID: <Edda1995Nov8.214414.3852@news.compulink.com>
Source record: 156634

Oct 29, 1995

To whom it may concern,

I have obtained an old pinball machine from a friend made by your company
It is a 1979 Superman pinball games. It does not work completley, and I am
interested in rejuvenating it for use. I would like to make a request for any
information that may help in fixing the game.
Known problems are that the bumpers and kickers are un-opperational. Also
when you press the flipper button; you get target points.
I would also like to refurbish the cosmetic aspects of it as well. Any tips on re-
making the game surface and painted parts would be really appreciated.
You can reach me through my friends address at zwarts@idirect.com.ca

Thank you
G.P Furfaro

1736. Re: TT media player SLOOOOW

Message-ID: <47rqr4$6te@bundy.mdk.se>
Source record: 156635

```
: It depends on what the jumpers on the motherboard are set to.
: My version of POVRAY 2.2 keeps up with a 486 DX2 50, running the same
: version of POV, same image, same resolution. I haven't tried switching
: it back to 16Mhz to see how much slower it is. The TT does burst mode if
: the jumpers on the TT Ram board are set correctly. I can't see why it
: can't do MPEG as fast as 486 DX 33's or faster machines, if I can get
: POV to run as fast as it does.

Well, there's other reasons than just the raw processing power when it
comes to mpeg decding. Having so called 'chunky pixels' graphic mode
is a clear advantage (PC 8/16 bit modes are such. Whilst the TT has
bitplane modes only (even the 8bit mode).

Sorry, no refunds on computer hardware from dealer :(. I have contacted
Michael Ruge, Werner Fry, Robert Schaffner, Don Maple. There seems to
be others with the same problems as I, and all were very helpful with
several ideas, unfortunately none has worked :(. But it is still nice
to have 32meg of Fast Ram, even at 16mhz. :) Ge-Soft never replied to
my letter concerning the problem.

You could have run `chmod -R +w .', which would have taken a
couple of seconds. :-)

> (.. Aren't there any proggies out there that'll do an
> unconditional file delete? Regardless of Write-prot?)

Sure, `rm -f' won't ask you any questions.

> Are there any proggies out there that'll just erase the FAT
> entry for a file without giving a hoot about where it Begins/
> Ends or for that matter exists?

Use CHKDISK3 to set the first byte of the offending file's
name to 229. Then run `analyse disk' to get back the lost
clusters.

> puts("Your OS is better than mine,");
> puts("All around the flame mail pours,");
> puts("Burning up the modem line,");
> }
> }
```

I'd say it's something like:

```
i=0;
while(1) {
i++;
gets(&s);
puts(strcat(s," is bullshit"));
puts("My OS is better than yours");
if (i=10) {puts("You're complete idiot"); i=0;}
}
```

Just modify the strings, and the same program works for "Origin sucks"
and so on.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am looking for the cable that goes from the monitor output in the ST to the monitor. I have an SC1224 but I do not have the monitor cable. If someone out there knows someone who has one could you please email me.

I am also looking for just the keyboard portion of the ST. My joystick controller went so I can no longer use the mouse. A simple replacement of the keyboard will fix this. If you have a junked ST with the keyboard still working I will buy it.

Yeah but what about when the TT has a graphics card? IIRC the original poster had an extremely flashy Matrix board and MPEGs were *still* slow.

My son just purchased two 800XL's and a 130XE.
I purchased Atari DOS II from B&C along with ST-Xformer
and cable. The first thing I noticed was that included
on the ST-Xformer disk was two other types of 8-bit
dos's (I forget the names). So was I suppose to
purchase two dos II copies, one for the ST and one for
the 8-bit's to utilize this software on my 1040ST,
as we usually run them at the same time? Am I a
pirate? Was it legal to include the other dos's
on the ST-Xformer disk?
I haven't read this thread before, but I am actually
shocked by DM's statement. I was thinking of purchasing
Gemulator 4, but tomorrow i'm pulling the
2.06 roms out of my 486, trashing the Gemulator, and
upgrading my new MegaST. Shit, I may even trash the 486.

;-)

Blimey, that's a bit drastic!! I would have thought that writing E5 to the first character of their name in the directory followed by a disc clean-up (HDCHCK or STTOOLS) would have done
it.

Here's another idea will could try, what if you can install MagiC to run on STonX? To be honest, if you're going to get a multitasking ST system with a seperate desktop then getting TOS 2.06 would be a bit of an over kill. Maybe someone can write a small program that loads MagiC in memory or the programmers could even write a version that works on STonX. Ethier way, the makers of STonX can get their money and people can still have ST emulation on their Unix box :)

> On the other hand, us users might want to contact Atari for an
> agreement on using TOS with STonX - if you don't mind, Marinos,
> that is.

Or maybe someone can ask them to put TOS on disk like MS-DOS. The TOS on ROM's work well on the ST's and even the emulators that use PC cards, but for an emulator that's free and runs on different platforms this would make it an easier idea than just having to install the chip only to use it once to get a image file. See, I keep coming up with good ideas :)

```
: MagiC 4.0 is available from now on,
: according to a news letter from ASH.

Do you know if the English version of it is released as well? Where can I
get hold of it? I have been wating for years (well, okay... months) for
this Falcon030 enhanced version. I want it real bad!

Great, just tell me the name of it and where it's at. I'll do the whole
campus a favor and put it on every lab Mac here :)

BTW, putting in a DD PC formated does "not" work on a Mac without a
built-in program that lab managers delete for some reason. And don't
even tell me about a application that comes with a very expensive set of
networking programs.

Actually all I really need is to use the DMA sound since it's my favorite
feature of the STe :)

If you can get this up and running, maybe on a 386, then you may as well
have a potiential customer. Two questions, can I use MagiC instead of a
TOS image file(imagine the competition losing someone who uses STonX
"legally" :), and can I run games that I can download?

Surprising for freeware, I see you guys put a lot of support into it.
Now that's what Atari is all about!

The Biz, by Orpheus Systems, is a commercial program, a demo of which was on the STFormat #46 cover disk, May 93. I imagine that that is where your BBS got it from. ST Format had a special deal on ordering the full version (70UKP versus 100UKP at retail). I have not seen anything about the Biz recently, but you might check with a retailer to see if they can import it.

>(something like that) even on low res.
>

Now... Let's make sure you have your facts straight.

#1. I am an avid OS/2 user, therefore yes I agree PC is better than Mac.

#2. Be very carefull when you compare Processors. Yes, Mac OS 7.5 on a PowerPC isn't the greatest. But it is the OS not the computer. The OS doesnot take advantage of the PowerPC that a native OS would.

#3. The PPC604/100 would kick a 4DX2/80 any day, if it were alowed to run in native mode.

If I were to chose between an OS, I would choose OS/2. But if I were to suggest an OS for my Mother.... It would have to be Mac OS.

To each his own... But make sure you compare apples to apples and oranges to oranges.

SORRY 8-(thought I was helping (goes off in a huff ;-))

1770. HELP!: HD problem...

Newsgroup: comp.sys.atari.st
Date: 1995-11-10 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <47u68j$f7a@southern.co.nz>
Source record: 156463

Hi There...

I was wondering if anyone can help me on a 'largish' problem. I have a
Falcon030 with 340 meg IDE drive split into the following logical drives...
C=12mb, D=110mb, E=110mb, F=110mb
I have lost access to logical drive D, but cannot determine why, or if it
is possible to recover the 100mb of info I have on it. I did the following
prior to the drive dying...

Copied 250 .WAV files (off a Win95 PC) from floppy to D:
Tried to play them with SAM. SAM crashes the Falcon with 4 bombs.
Compressed disk with Chkdsk 3. Chkdsk 3 says 1 sector is corrupt.
Recover sector.
Delete some of the files to make a bit more room...
Computer will now not tell me info on D: via 'Show Info'.
A couple of cold starts later, drive access (until now still able to get
stuff) is completely lost.

I have two thoughts...One, that the extended file system used by Win95
(long filenames as ALL the .WAV files were in long format to begin, but
chopped down to 8.3 when dumped to floppy by the 'infamous' Win95
algorithm) has confused GEMDOS, and it has corrupted its FAT, or BPB for
drive D:. Chkdsk 3 now says that the BPB is unreadable. HDX says that
the bootsector is corrupt, or made with another HD Driver. Knife ST says
that the boot sector is non-standard. The other thought is that a sector
(maybe one under the BPB/FAT for D:) is now corrupt.

If anyone has had similar trouble and/or knows how to recover the drive,
then please e-mail me ASAP. I would be MOST grateful, as I've possibly
have lost a lot of VERY NEEDED software. Is there software to write a
copy of the FAT/BPB to a floppy, and re-write it if need be? That would
be a good way of saving the disk if ever the same problem occured again
(NEVER HOPEFULLY!!!). I don't wish to reformat the WHOLE physical unit,
so don't be shy if you know of a possible fix for this...

Thanks for your replies,

Chris Wilkinson. <chriswil@southern.co.nz>

Damn straight. I've already mailed the author of Oasis about this problem, but he doesn't appear to think it's important. Yet every time somebody follows-up an article using Oasis, Free Agent thinks they've started a new thread - as do a billion other _real_ newsreaders. Sadly, few Oasis users are likely to draw this to Phil's attention as the majority of them don't know any better.

Yep - this could well be it. I'm not up on how the 604 compares with the 601 - but if it can emulate a 486 and 68040 at a decent speed then it will do for the moment. The OS is going to be 'fun' to write though.

:-)

Hmm.. About the minimal MiNTNet system is 1MB RAM, and a DSDD floppy drive.
That gives you enough to telnet via PPP, and nothing else.

Have you turned off Caching? That's what will happen if Write
Cache is turned on. It is mentioned in the manual, for Tape backups only.
Personally, I turn off all caching when I am backing up and the few times I
have had to do a restore.

Does it still only support slip or has PPP support been added?

1776. Re: Help! Can I read MAC disk with an ATARI 520STE?

Newsgroup: comp.sys.atari.st
Date: 1995-11-10 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <b97cb$152a26.269@goldengate>
Source record: 156469

I'm not sure if there is a program to allow you to read a mac disk directly
but something stickes in the back of my mind that I saw just such a
utility either at Hensa or Umich...

If not here's a roundabout solution to your problem...

There is a utility available for Macs that allows them to read and write to
a IBM format disk. If you're lucky enough to be using a power mac, it's
part of the os. If not locate this utility on the net.
With this installed on the mac save the file to a preformatted (straight
out of the box. DSDD formatted for IBM) disk. Take the disk home and pop
it in the drive and voila!
I have not been able to make this work with a disk formatted on my st,
though. It seems that the ST can read an IBM disk but necessarily the
other way around. Especially, If you use a twisted format.
the disks that I use are Sony MFD-2DD's. The fact that they are
preformatted for the IBM is on the front of the box.
Hope this helps!

1777. FZDT Question

Newsgroup: comp.sys.atari.st
Date: 1995-11-10 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <b97cb$1602a.e1@goldengate>
Source record: 156470

I seem to be having a problem with FZDT. It seems to keep crashing on me in certain circumstances. Most notably:
1. When FTP-ing. It crashes when ever I cd and dir into a directory with a large number of listings. ie. Umich atari/utilities/. It begins to list the files and then freezes. When I drop carrier and reconnect to my server, I loose all ability to send input. I get the connect message and it just sits there. I have to turn off the st, reset the modem, and relaunch the program. A "warm" reboot is ineffective.
2. I encountered a similar problem while using the ascii send feature the other night on a local BBS. It sent about 2/3 of the file (not a very large one at that) and froze. Again the "warm" reboot resulted in the problem mentioned above.

If this is of any help. I'm running a mega ST2 with Neodesk. The only thing that I'm running with FZDT is the rainbow tos patch. No warp 9, alternate file selecters, da's etc.
I used to use teddy term and never had any of these problems. It's a much smaller program and doesn't support a scrollback buffer. Could it be that I'm running out of memory?
Any insights?

1787. Bourne compatible shell wanted

Newsgroup: comp.sys.atari.st
Date: 1995-11-10 00:00:00 UTC
From: jmf@informatik.uni-koblenz.de
Message-ID: <47vl26$9m7@newshost.uni-koblenz.de>
Source record: 156480
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

is there any shell for the Atari that's 100% Bourne-Shell compatible?

I need it to port GNU-distributions which always require shell scripts
to configure the environment.

I tried BASH 1.13.1 that complains about "do"s on a single line, ksh
(4.8 MiNT r1.1Beta) that doesn't handle "for"-exit codes on premature
termination correctly, and sh from the MiNTOS 1.4.1 distribution, that
still requires GEMDOS-conformant suffixes to execute a program.

C-shells would be of little use as they are Bourne-shell incompatible
anyway.

There has to be a no-frills 100% Bourne-compatible shell somewhere?

Anyone got an idea?

Well, I've managed to trap him between the wall & the door to the corner room.
He is difficult to finish off, may take several attempts.
He does tend to teleport away just when you think you have him.

You do need the Firestaff, make sure you have it fully functional.

From: cj439@FreeNet.Carleton.CA
Message-ID: <DHuC1t.9tF@freenet.carleton.ca>
Source record: 156485

My megaFile 30 took a short vacation recently; I've got it back now, but while it was gone, I missed it so, I searched out a replacement RLL mechanism. I'm looking now for a dead MegaFile (hopefully, cheap), but with a good power supply and host adaptor, to pop this other mech into. I think it could be any size MegaFile from 30 up (I'm not sure but what the 20's may have been a different type of drive mech). If you have such a beast around, and if you're not using it for anything more critical than a monitor stand, I'd like to have a backup system. When my drive went out, i felt like my brain was disconnected!

Sex, Anyone? Not tonight, my Atari has a headache!

I just picked up, by accident, a Koala Tablet, for 8-bit Ataris.
I wondered, will it work with an ST? It has the same plug as ST
mouse/joystick. If it will work, there are two more available, still in
boxes, and cheap, as the fellow who has them doesn't have a clue what
they're for.

> TOS 3.06 is 30% faster than stock TT and the machine can go dual platform).

Another Atari TOS type machine would be nice, but they are much too
expensive and I don't think it would pass customs because they are not
FCC compliant. Yes, I'd love to have an '060 based machine that can
launch the space shuttle, but its way too high priced.

Not to preach PC's (which suck overall, but it's what I have now), I have
an Orchid Kelvin VLB graphics card with 64 bit graphics processor
(acceleration chip, blitter, etc.). It has 2 megabytes, 16.7 million
colors up to 800x600 and 1280x1024 at 256 colors. I usually use it at
1024x768 with 65536 colors. I only paid $219 for it. It runs with a
50MHz bus speed.

I could have paid $350 for the 4 megabytye version, but I didn't need
that much.

Now, what is so special about the graphics card in the Medusa and Eagle
that they have to charge a king's ransom for it??

> The fastest Atari machine with the fastest industry standard graphics chip
> quite a combination.

For the price, I can get a 133MHz Power Macintosh for a similar price with much more inside to use. Besides, it runs PC, MAC, and Atari software. It also has the PPC chip of which the 68060 uses a subset of its architecture except the PPC is a RISC chip and the '060 is a CISC processor. Both run three instructions in parallel, etc.

So why should I spend a fortune on import fees, shipping fees, voltage converters, etc?

I really like TOS machines, but they are way too under-engineered now days for the price.

You don't need a power PC -- any MAC running system 7.5 can read or write IBM disks, and the Atari can read those. Earlier versions of the operating system need the software program Access PC (I'm assuming that your MAC isn't ancient and has the disk drive capable of doing this).

There is also a program for the Atari that will allow it to read MAC disks, but I am pretty sure that it only works with high density disks, and I doubt if you have that kind of a disk drive on a 520ST. If you can get hold of a used Spectre program, that shouldn't be too expensive and will allow you to read MAC disks too. (I'm not sure if you need 1 meg on your Atari for Spectre).

No, it cannot.
